CHAPTER 1

Welcome to EmpressDreams

EmpressDreams is a complete online store and in-shop point of sale (POS) for cosmetics, skin care and fashion. This guide explains every part of the system, step by step, with screenshots.

1.1 What is included

Module	What it does	Who uses it
Online store	The public shop at https://empressdreams.com - browse, filter, add to cart, pay by Cash on Delivery, QR payment or bank transfer.	Customers
Customer account	Orders, addresses, GlowPoints balance, saved skin analyses.	Customers
Admin panel	Manage products, orders, coupons, pages, settings at https://empressdreams.com/admin.	Owner, staff
POS terminal	Touch-friendly in-shop till at https://empressdreams.com/admin/pos - barcode scanning, split payments, 80 mm receipts.	Cashiers
GlowPoints	Customer loyalty points that are earned on purchases and redeemed for discounts.	Customers, owner
Skin Analysis	Camera-based skin report with tips and product suggestions at https://empressdreams.com/skin-analysis.	Customers
Beauty & Fashion tools	Ingredients, how-to-use, fabric and care, size guides, expiry batches, barcodes and labels.	Owner, staff

1.2 Important addresses

Purpose	Address
Online store	https://empressdreams.com
Admin panel (login)	https://empressdreams.com/admin
POS terminal	https://empressdreams.com/admin/pos
Skin analysis	https://empressdreams.com/skin-analysis
Customer account	https://empressdreams.com/account
Customer login / register	https://empressdreams.com/login
Sales & returns (POS)	https://empressdreams.com/admin/pos/sales
Barcodes & labels	https://empressdreams.com/admin/pos/barcodes

> **NOTE**
> `admin.empressdreams.com`, `api.empressdreams.com` and `www.empressdreams.com` all redirect to https://empressdreams.com. The admin panel is simply the `/admin` page of the same site.

1.3 Logging in

Staff and owners sign in at the admin address with the email and password created for them. The first admin password was set during deployment and is saved in a protected file on the server (see Chapter 15). Change it immediately after your first login under **Profile**.

> **IMPORTANT**
> Never share the admin password. Create a separate user for each staff member (Chapter 13) so you can see who did what and remove access when someone leaves.

CHAPTER 2

First-time setup checklist

Follow these steps in order the first time you set up the live store. Each step is explained in detail later in the guide.

1. **Check store details** - Settings -> Store: store name, tagline, email, phone and address. (Placeholder values from testing must be replaced.)
2. **Check currency and country** - Settings -> General and Currency. The store is set to **Nepal** and **NPR**.
3. **Add categories and brands** - Products -> Categories and Brands (Chapter 4).
4. **Create attributes** - Skin Type, Concern, Material, Fit and so on, so customers can filter products (Chapter 4).
5. **Add products** - Products -> Create Product. Use variations for sizes, colours and shades.
6. **Add Beauty & Fashion details** - ingredients, how to use, material, care, size chart and expiry batches.
7. **Print or assign barcodes** - Admin -> POS -> Barcodes & Labels.
8. **Turn on payment methods** - Cash on Delivery, QR Payment (upload your real QR) and Bank Transfer (enter real account details).
9. **Set shipping and tax** - Settings -> Shipping Methods and Products -> Taxes (VAT 13% is preconfigured).
10. **Design the home page** - Appearance -> Sliders and Storefront (Chapter 12).
11. **Set up POS** - POS -> POS Settings (receipt header, PAN/VAT number, paper width) and print a test receipt.
12. **Test an order end-to-end** - place a test order on the store, then a test sale in POS, then delete the test data.

> **TIP**
> Do your test orders with a coupon or Cash on Delivery, then cancel them. Orders you cancel do not earn GlowPoints and put stock back.

CHAPTER 3

Admin panel basics

Everything the shop owner does happens in the admin panel.

3.1 Signing in

1. Open `https://empressdreams.com/admin`.
2. Enter your email and password and press **Sign In**.
3. You land on the **Dashboard**.

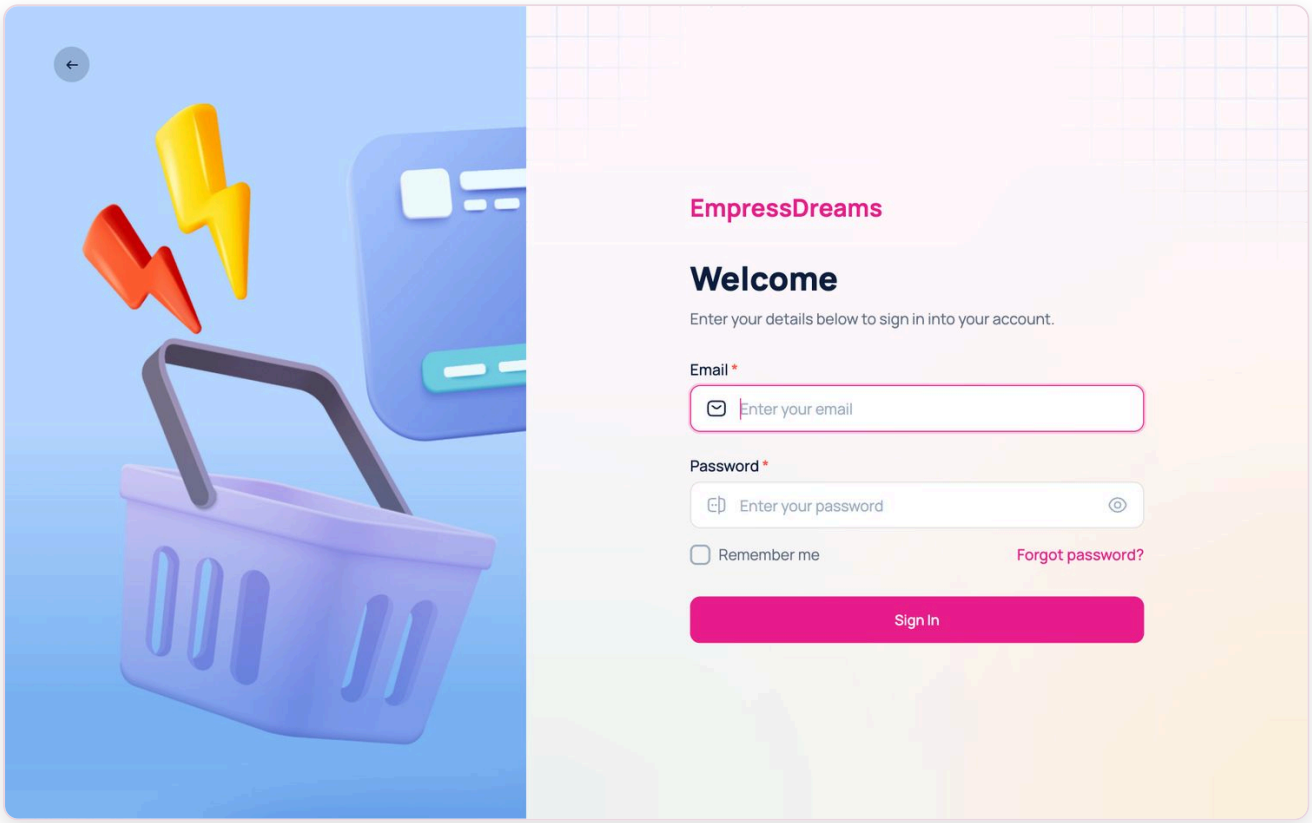

Figure 1. The admin sign-in page.

3.2 The dashboard

The dashboard gives a quick overview: total sales, number of orders, products and customers, a weekly sales chart, the latest searches made on the store, latest reviews and the latest orders. Click an order to open it.

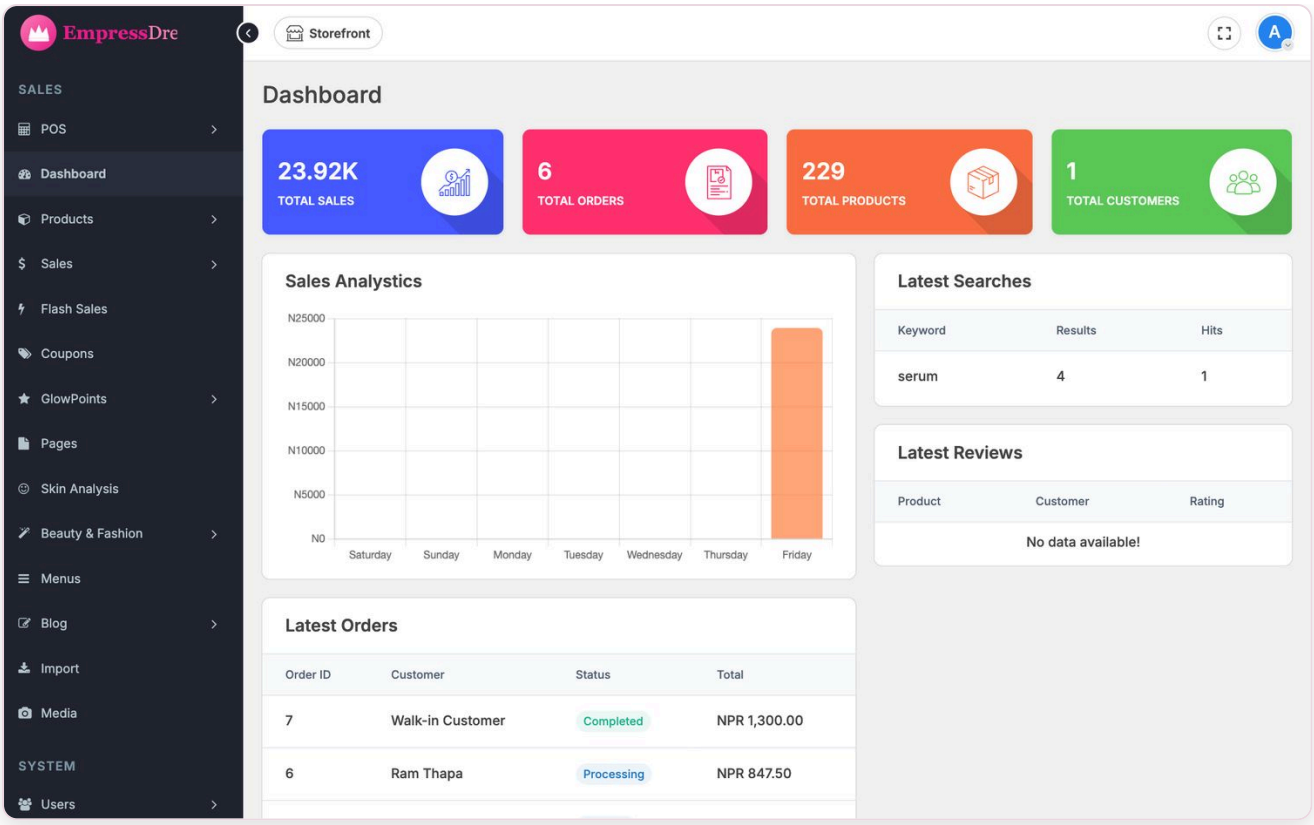

Figure 2. Dashboard with totals, sales chart and latest orders. The left menu leads to every section.

3.3 Finding your way around

Menu	What is inside
POS	Open Terminal, Sales & Returns, Registers, Barcodes & Labels, POS Settings
Products	Create Product, All Products, Categories, Brands, Attributes, Attribute Sets, Variations, Options, Tags, Reviews
Sales	Orders, Transactions
Flash Sales / Coupons	Time-limited price campaigns and discount codes
GlowPoints	Transactions (ledger and manual adjustment) and Settings
Pages / Menus / Blog	Content pages, navigation menus and blog posts
Skin Analysis	Enable/disable, disclaimer, optional AI second opinion, saved results
Beauty & Fashion	Product Details, Size Charts, Batches & Expiry
Import / Media	Bulk product import and the media library
System	Users, Roles, Localization (languages, currency rates), Appearance (sliders, storefront), Reports, Settings

3.4 Working with tables

- Every list has a **search box** (top right), a page-size selector and sortable column headings.
- Click a **row** to open the item, or tick rows and use **Delete** to remove several at once.
- The **Create** button (top right) adds a new item.

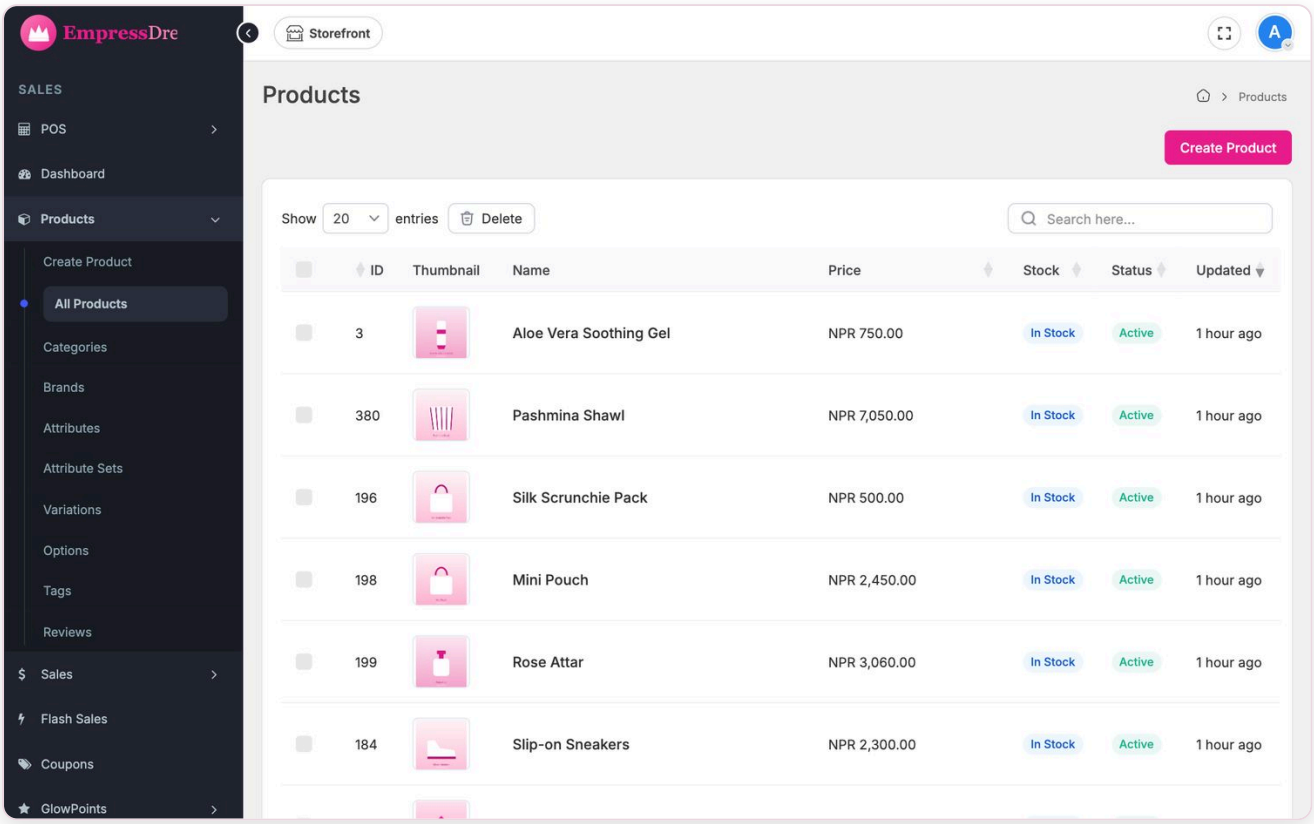

Figure 3. A typical list page. Use the search box to find a product by name.

CHAPTER 4

Catalogue: categories, products and variations

The catalogue is organised as Categories -> Products -> Variations. Filters on the store are built from Attributes.

4.1 Categories

Categories group products and drive the store menus and filters. The store ships with two top-level groups, **Cosmetics** (Skincare, Makeup, Hair Care, Fragrance) and **Fashion** (Women's Wear, Men's Wear, Footwear, Bags & Accessories).

1. Go to **Products -> Categories**.
2. Click **Add Root Category** for a top-level group, or select a category and click **Add Subcategory**.
3. Enter a **Name**, tick **Searchable** if it should appear in the search-box category list, and tick **Status** to enable it.
4. On the **Image** tab upload a logo (used on the home page category tiles) and a banner.
5. Click **Save**.

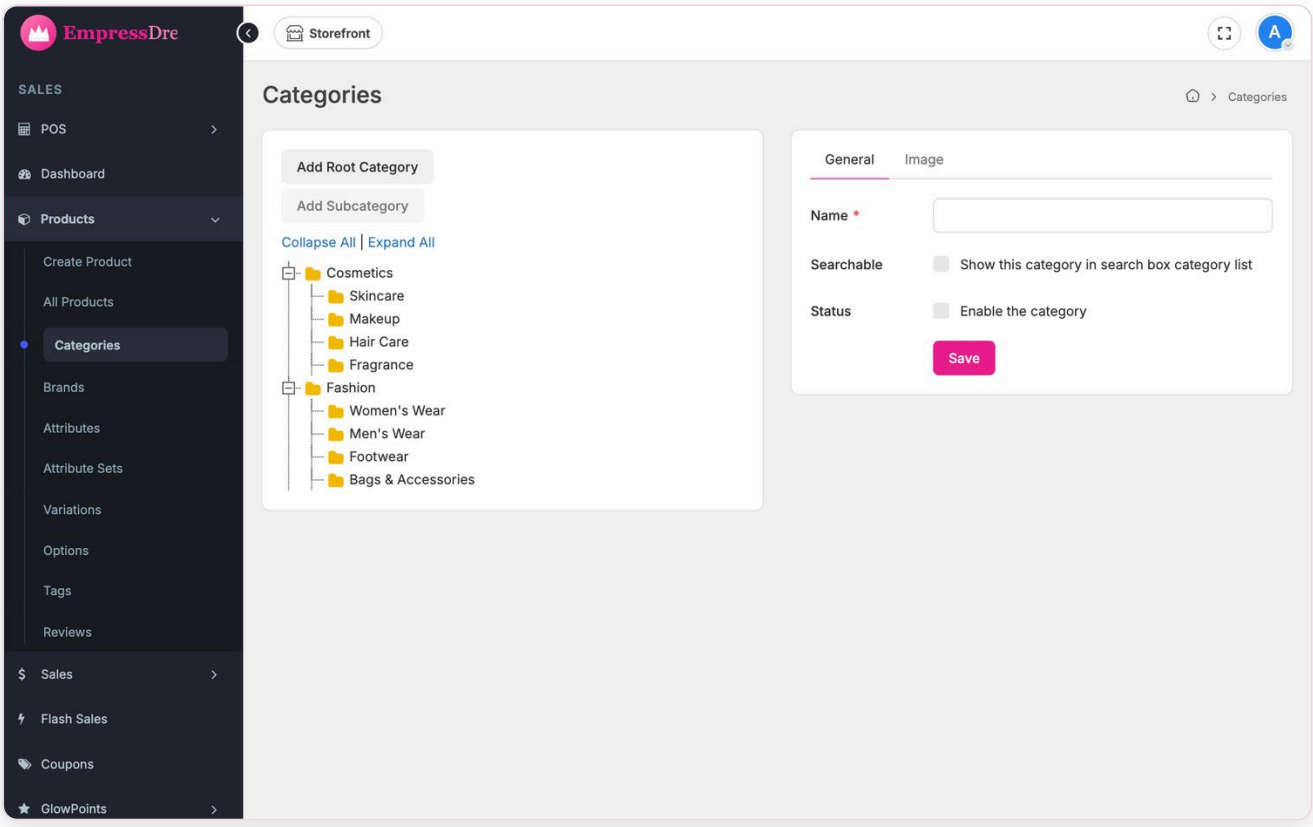

Figure 4. Category tree with the add form on the right.

4.2 Brands

Brands appear on product pages and can be shown on the home page. Go to **Products -> Brands -> Create Brand**, enter the name, upload a logo and enable it.

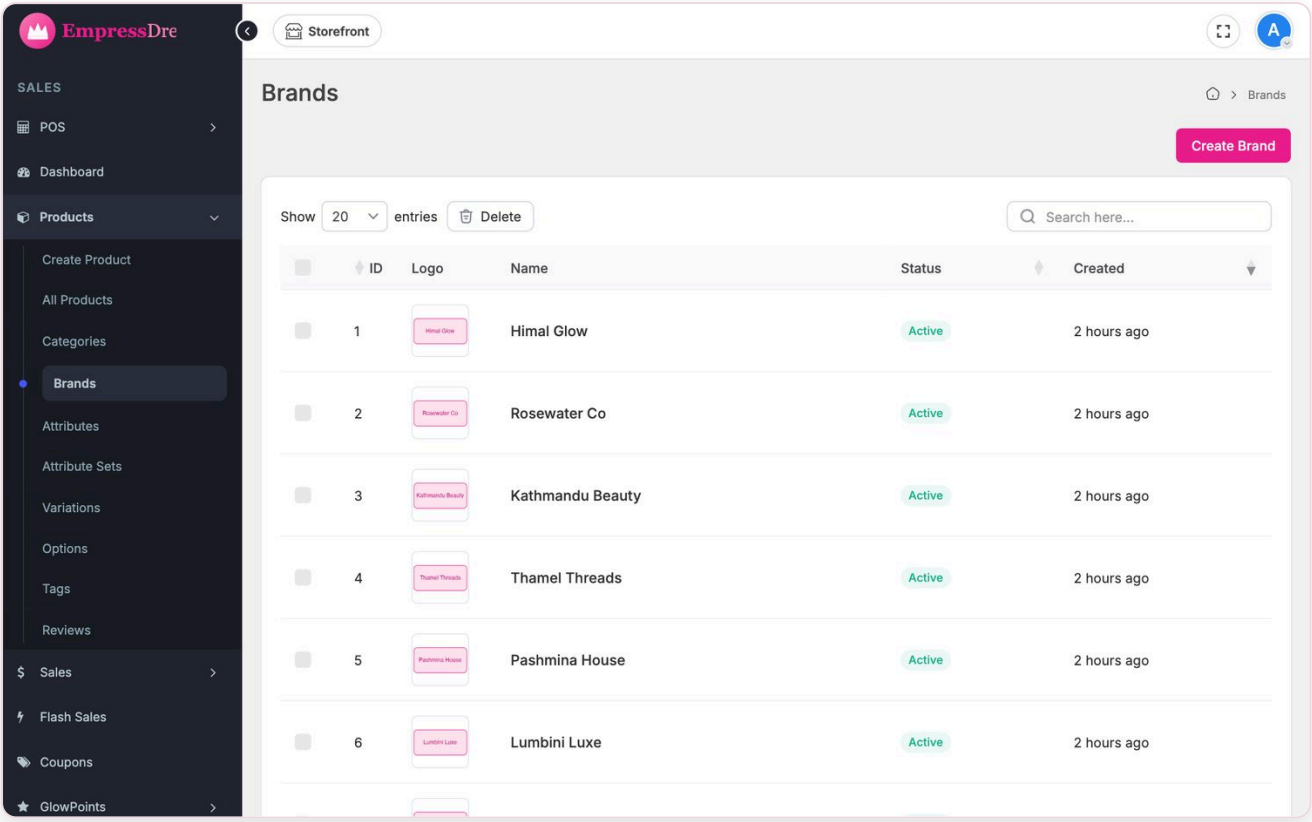

Figure 5. Brand list.

4.3 Attributes and attribute sets (filters)

Attributes describe products in a way customers can filter by - for example Skin Type, Skin Concern, Key Ingredient, Finish, Material, Fit and Occasion. Each attribute belongs to an **attribute set** and is linked to categories; only the attributes linked to the category being viewed are shown as filters.

1. Go to **Products -> Attributes** (and **Attribute Sets** for groups).
2. Click **Create Attribute**, choose the set, name it, and list its values.
3. Tick **Filterable** to show it in the store sidebar.
4. On the **Categories** field choose where it applies.
5. When you edit a product, the **Attributes** section lets you pick the values for that product.

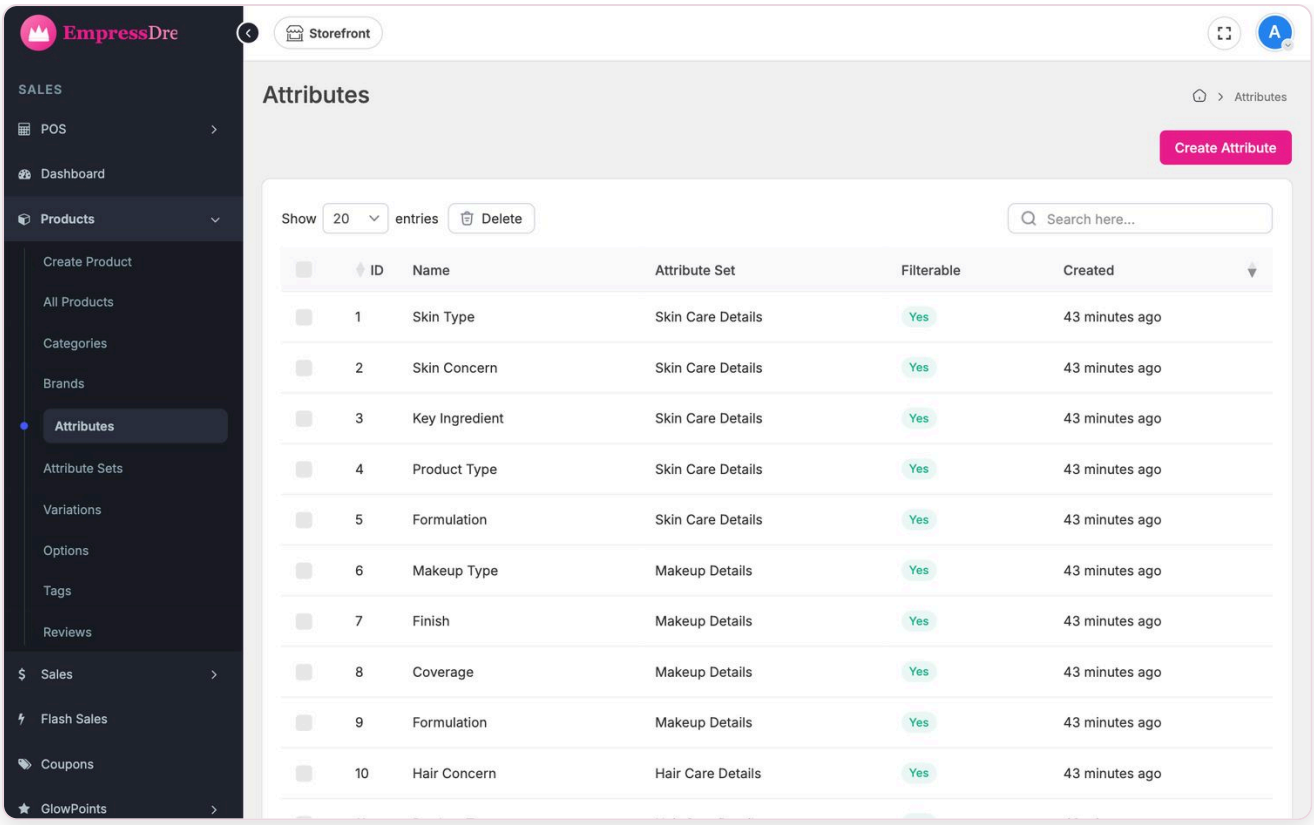

Figure 6. Preconfigured attributes for skin care, makeup, hair care, fragrance and fashion.

> **TIP**
> Keep attribute values short and consistent (for example always `Oily`, never `oily skin`). Customers see exactly these words in the filter list.

4.4 Variations: sizes, colours and shades

A **variation** is something customers choose on a product page, such as Size, Colour, Shade, Volume, Waist or Shoe Size. A variation can be of type **Text**, **Colour** (shown as round colour swatches) or **Image**.

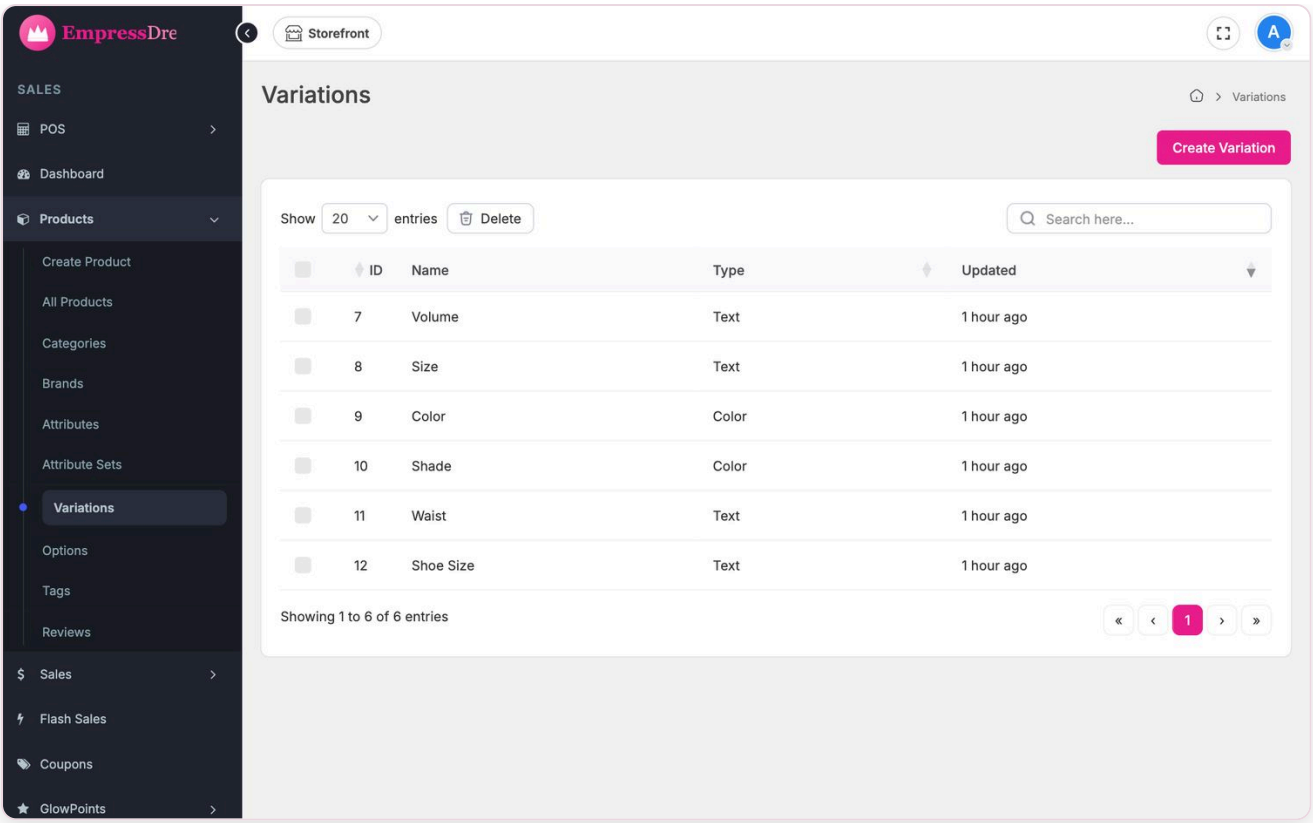

Figure 7. Global variations: Volume, Size, Color, Shade, Waist and Shoe Size.

When you add variations to a product, the system builds every combination (for example 4 sizes x 3 colours = 12 variants). Each variant has its own price, stock, SKU and barcode.

4.5 Creating a simple product

1. Go to **Products -> Create Product**.
2. **General**: enter the name and description, pick the categories, and tick Status.
3. **Price**: base price (in NPR), optional special price with start/end dates.
4. **Inventory**: SKU, stock management and quantity.
5. **Brand, Tax Class, Tags, Attributes**: choose the brand, tax class (Nepal VAT) and attribute values.
6. **Media**: upload a base image and additional images.
7. Click **Save**.

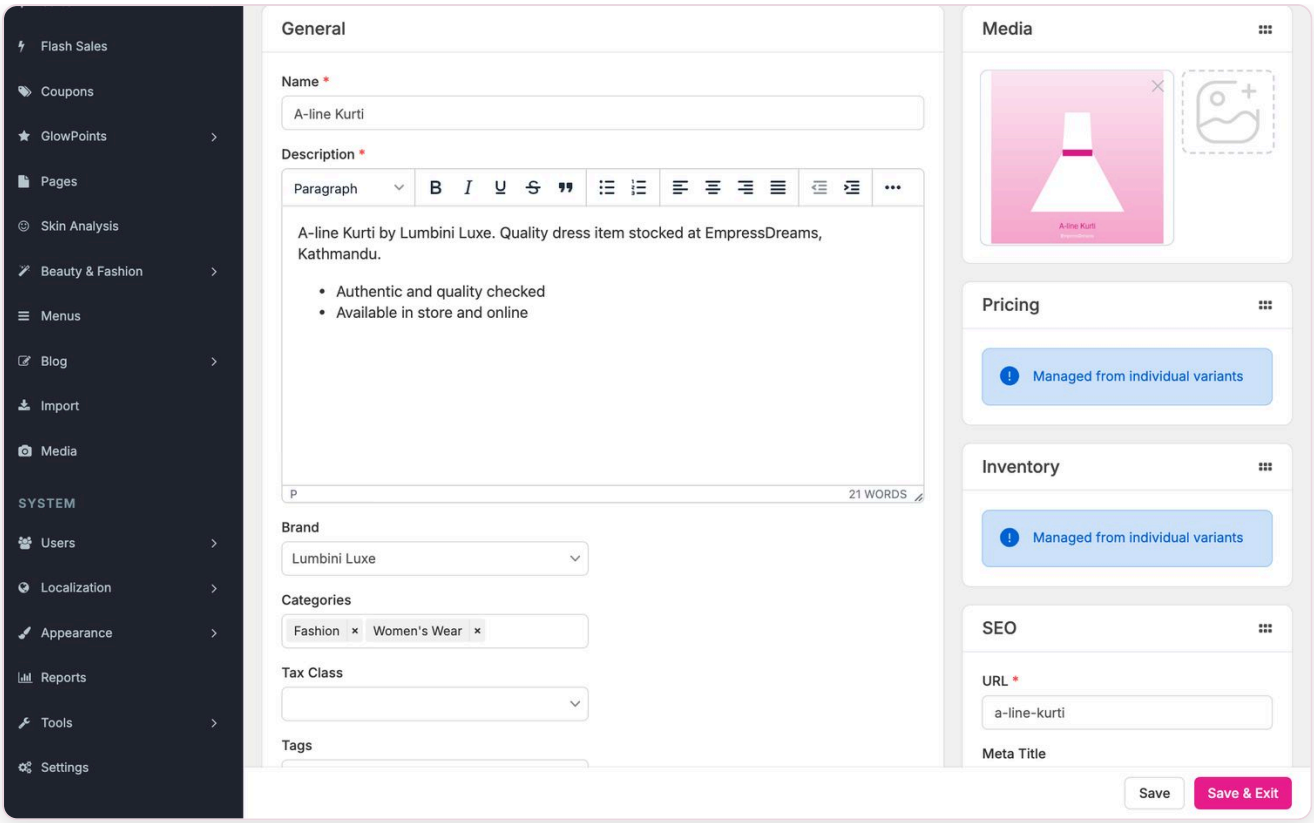

Figure 8. Product edit form (General, Media, Pricing, Inventory and SEO panels).

4.6 Creating a variable product

1. Create the product as above, but open the **Variations** panel.
2. Add a variation (for example Size) and choose its values; add a second one (Color) if needed.
3. The variants table appears. Set the **price, special price, SKU, quantity and images** for each variant, or use **bulk edit**.
4. Mark one variant as **Default** - it is the one shown first.
5. Save. Each variant gets its own barcode automatically.

> **NOTE**
> When a product has variants, stock is managed on the **VARIANTS**, not on the parent product.

4.7 Beauty & Fashion product details

Below the product edit page header there are two helper boxes added for this store. Click **Beauty & Fashion details** to expand it.

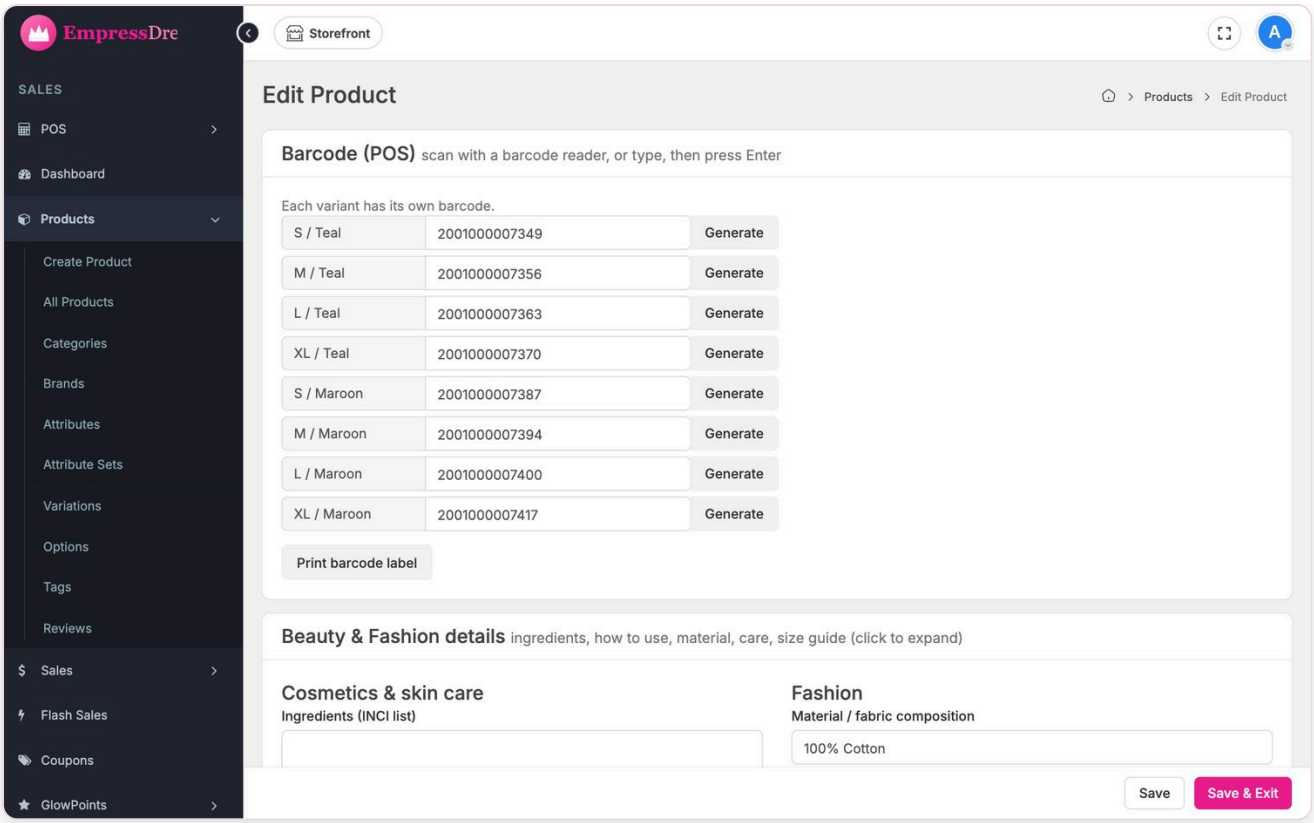

Figure 9. The **Barcode (POS)** box and the collapsible **Beauty & Fashion details** box at the top of a product's edit page.

Field	Shown to customers as
Ingredients (INCI list)	Ingredients, in the **Ingredients & Usage** tab
How to use / Benefits	How to use and Benefits, same tab
PAO (months), Shelf life, Net content	"Use within X months of opening" badge and facts grid
Material, Care instructions, Model info	**Fabric & Care** tab
Size chart	A **Size guide** link and pop-up
Country of origin	"Made in" fact

You can also edit these for many products from the list at **Beauty & Fashion -> Product Details**.

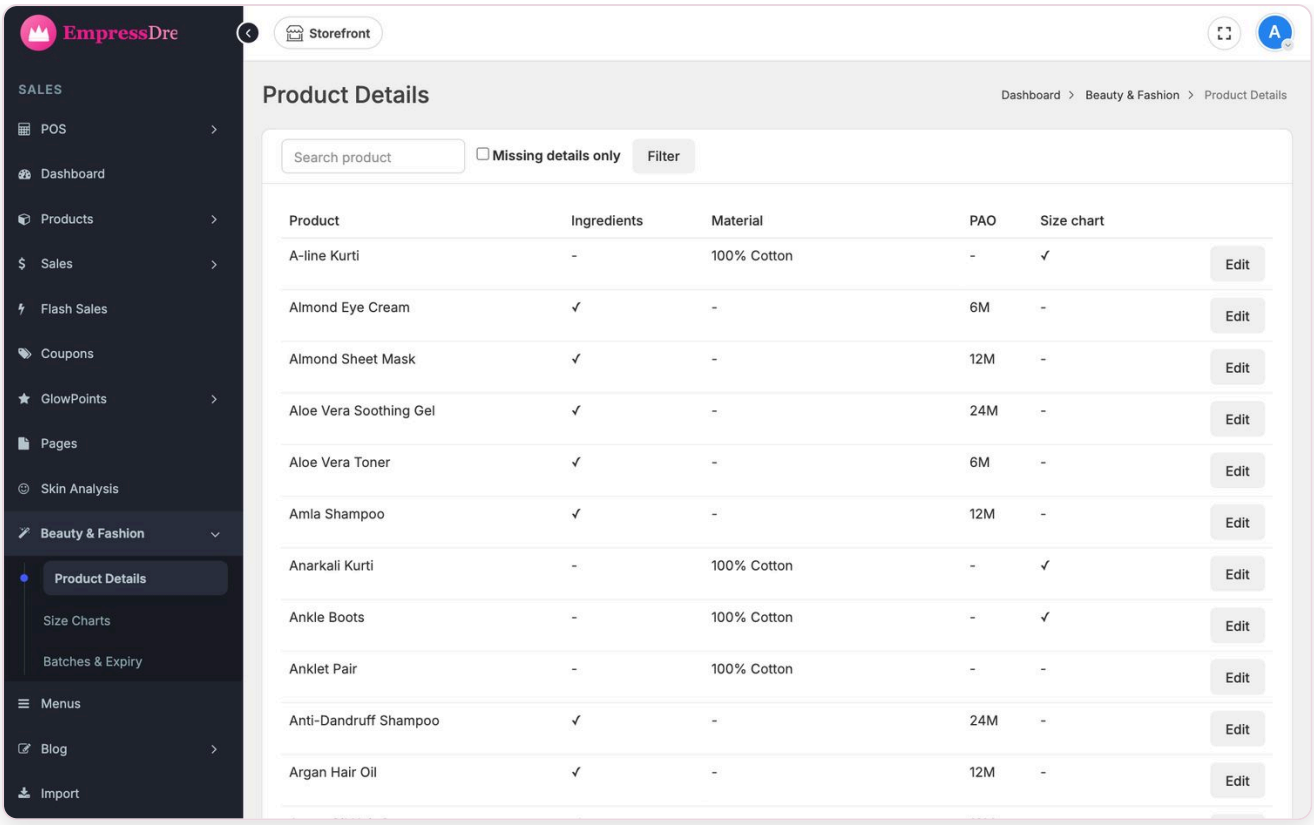

Figure 10. Product Details list: a tick shows which products already have ingredients and size charts.

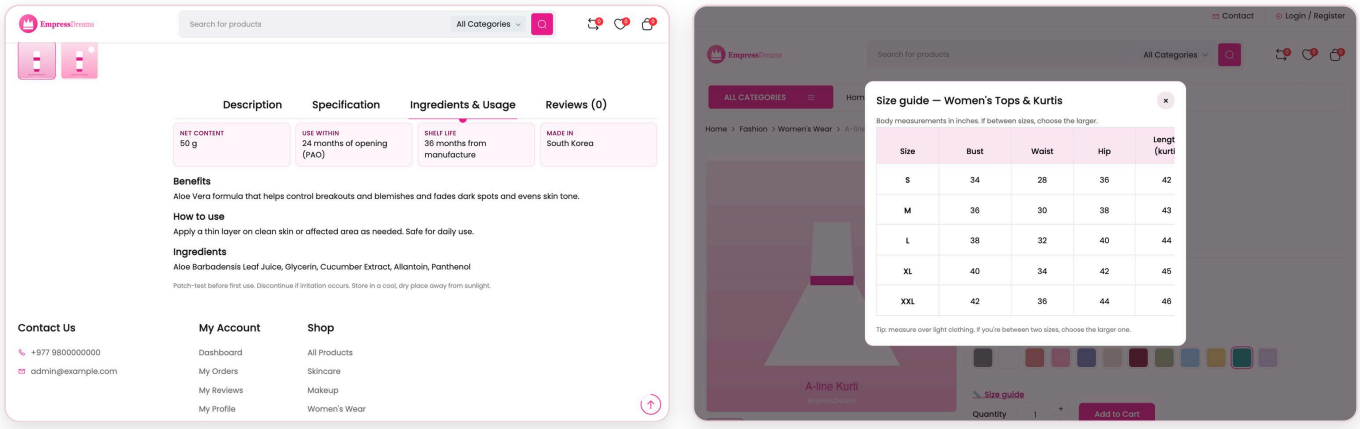

Figure 11. What customers see: the Ingredients & Usage tab and the size guide pop-up.

4.8 Size charts

Create a chart once and attach it to many products. Go to **Beauty & Fashion -> Size Charts -> New size chart**. Enter the column headings separated by commas, and one row per line with values separated by commas.

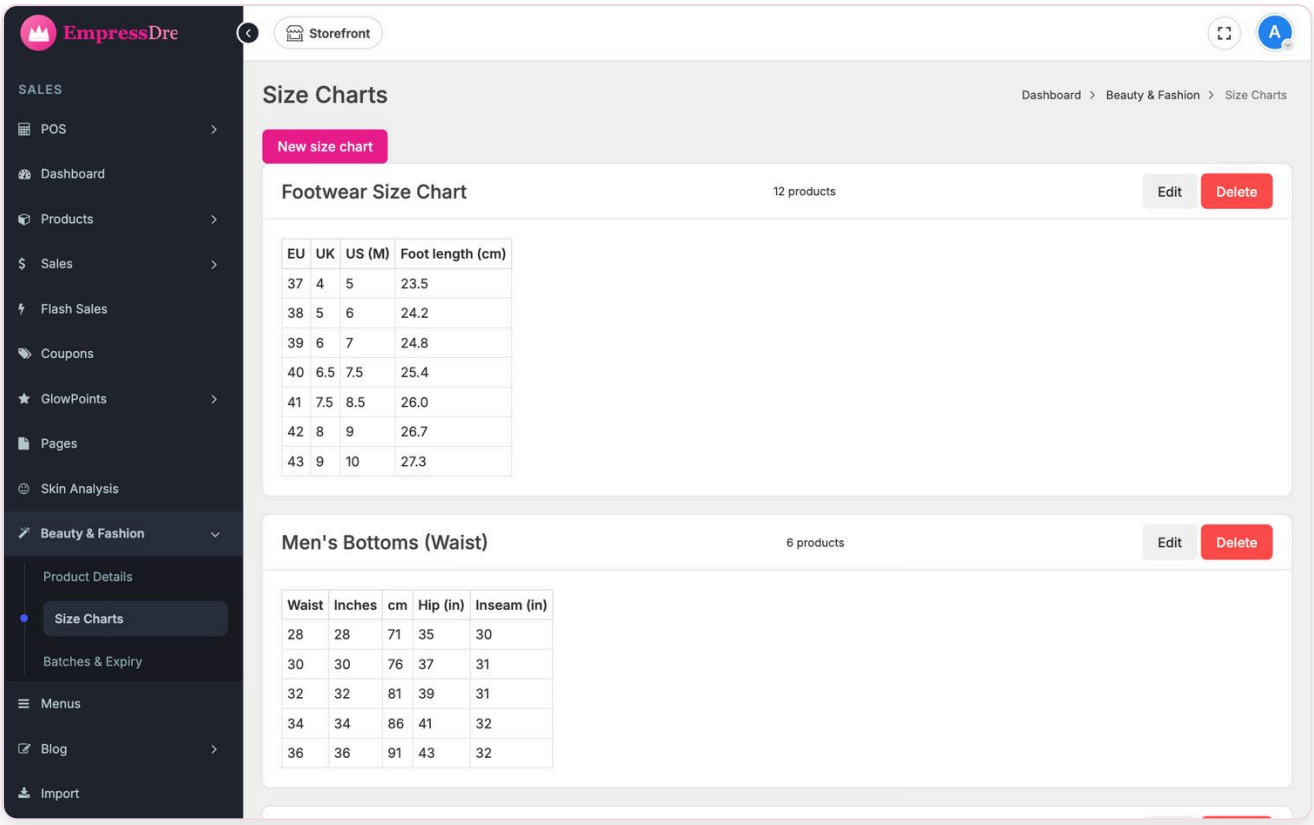

Figure 12. Size charts for women's tops, men's tops, men's waist sizes and footwear.

4.9 Expiry batches (cosmetics)

Cosmetics expire. Under **Beauty & Fashion -> Batches & Expiry** record each delivery with its batch number, manufacture and expiry date and quantity.

- The three cards show total batches, **expired** batches and batches **expiring within 90 days**.
- The **Needs attention** tab lists problems first.
- **Write off** removes an expired batch and subtracts its quantity from the product stock.
- Ticking **add to stock** when adding a batch also increases the product quantity.

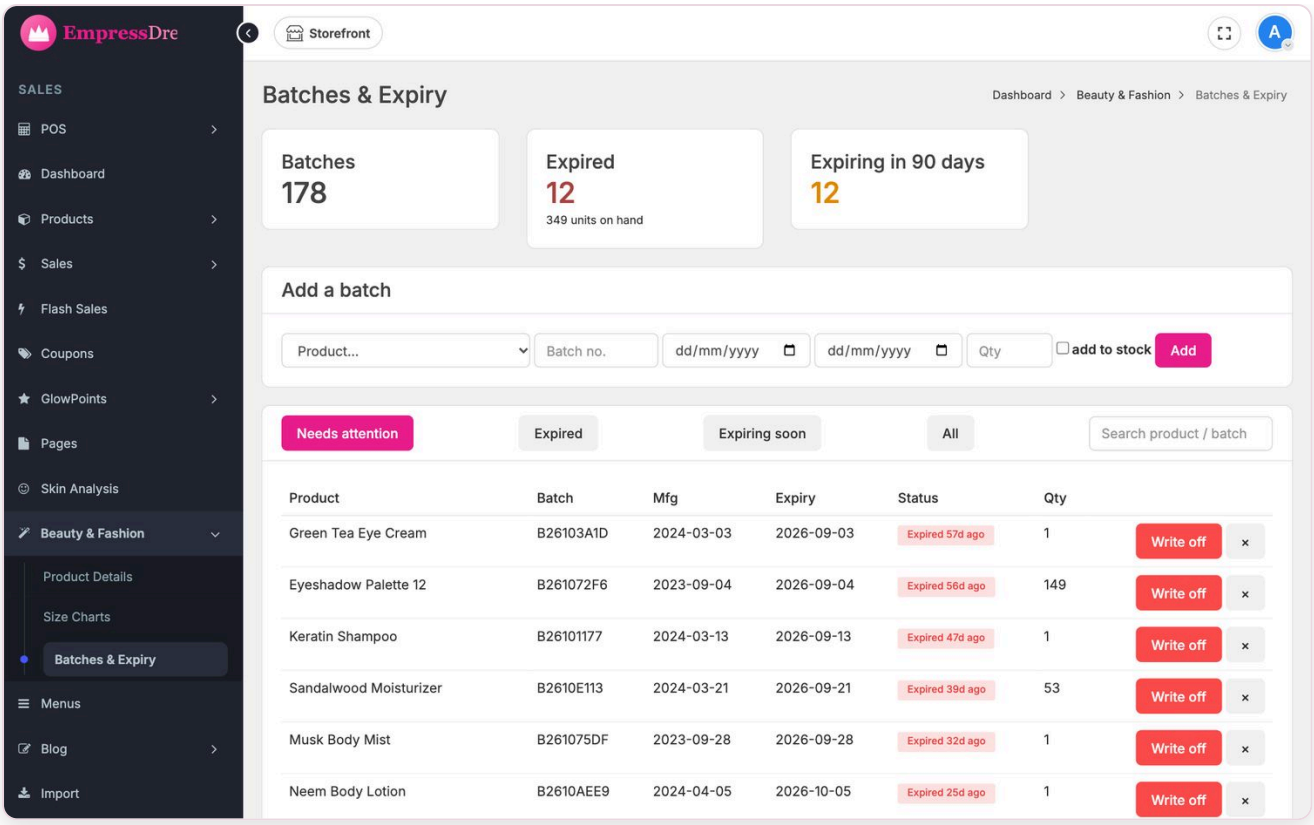

Figure 13. Batches & Expiry with expired and soon-to-expire batches highlighted.

IMPORTANT

Batches are a tracking and alert tool. They do not stop the till from selling a product. Check the page weekly and write off expired stock.

4.10 Bulk import and the media library

- **Import** (Products -> Import): upload a CSV/Excel product file and, optionally, a ZIP of images to add many products at once.
- **Media**: the central library. Drop files on the page to upload; select files and press **Delete** to remove them. Pick from here when adding images to products, categories, brands, sliders or pages.

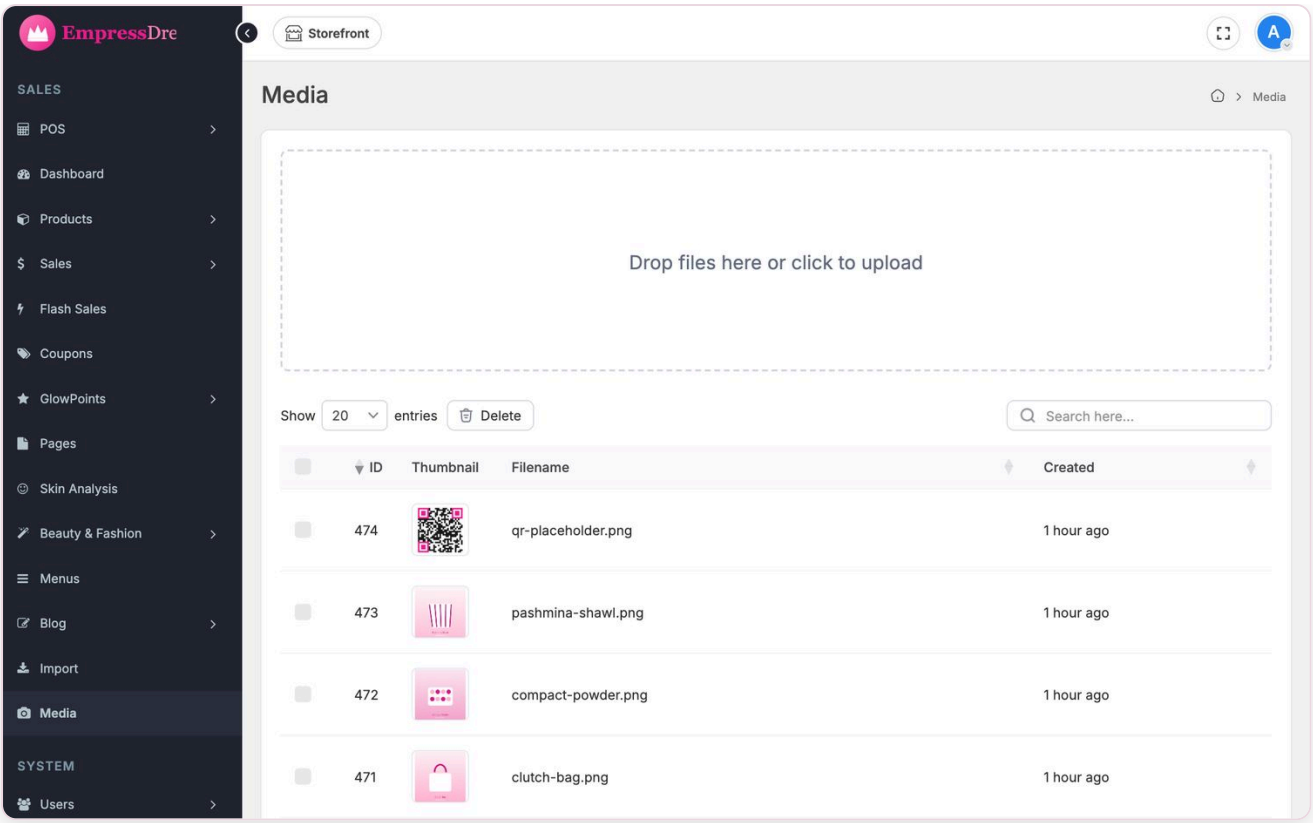

Figure 14. Media library.

CHAPTER 5

The online store (what customers see)

This chapter walks through the customer experience. Everything is mobile friendly.

5.1 Home page

The home page shows the main slider, category tiles, product tabs (New Arrivals, Skincare, Makeup, Fashion), top brands and more. All sections are controlled from **Appearance -> Storefront** (Chapter 12).

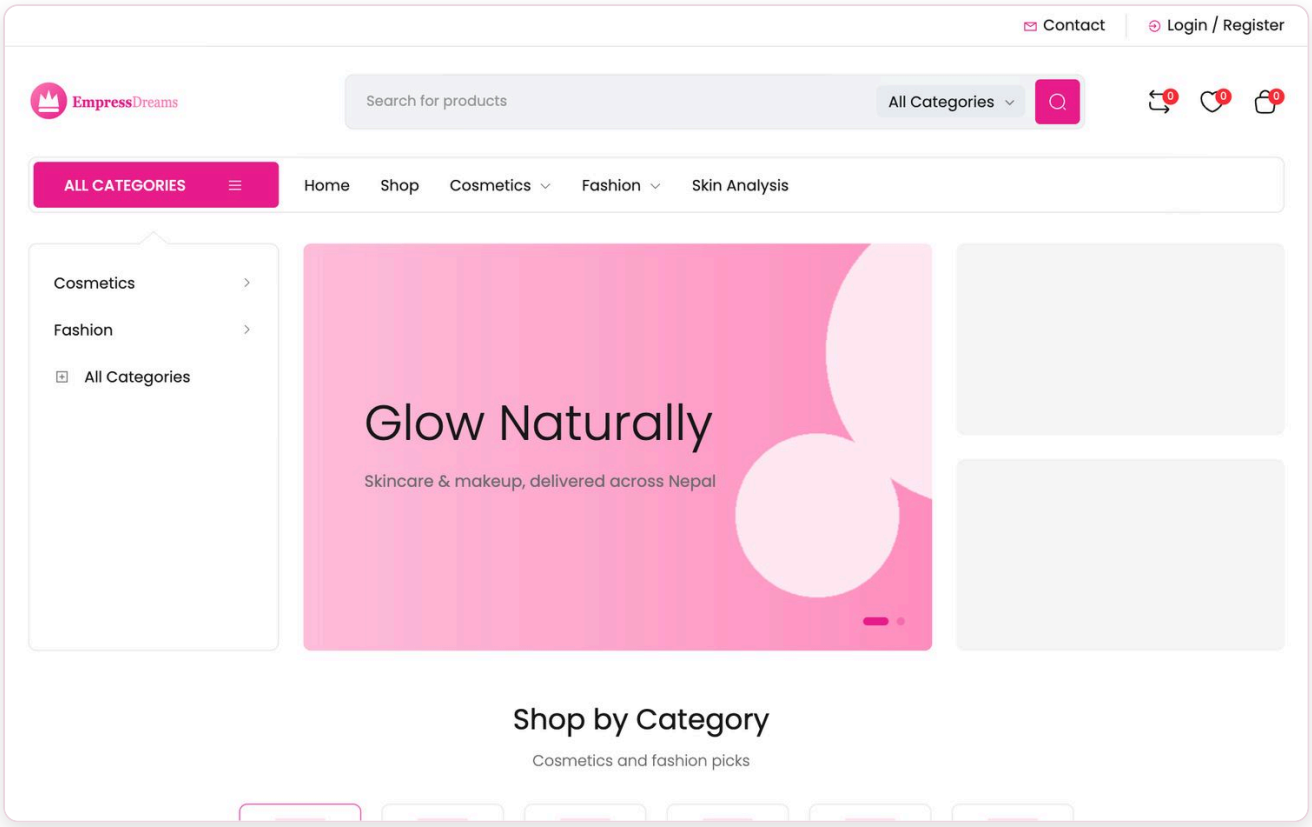

Figure 15. Home page with the menu bar, category menu and slider.

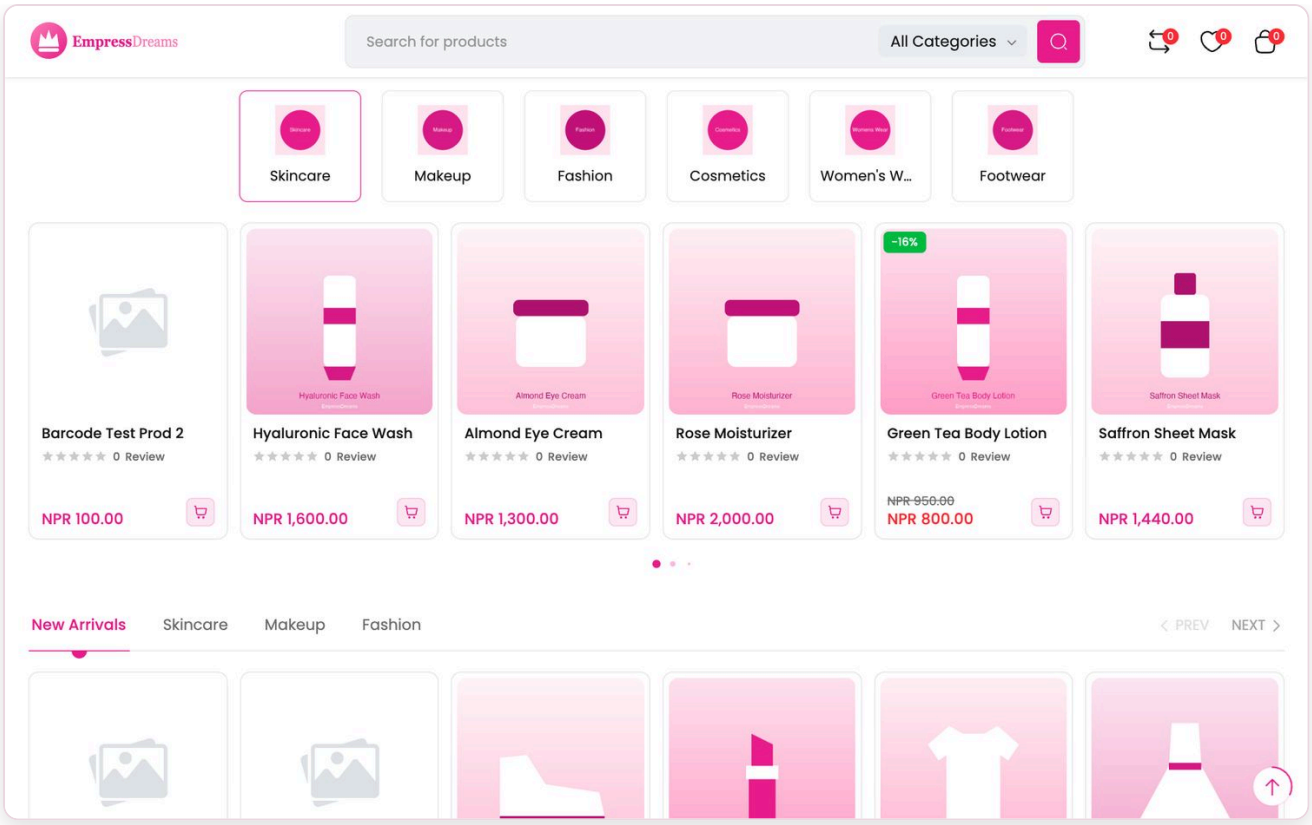

Figure 16. Home page sections: category tiles and product tabs.

5.2 Browsing and filtering

Customers pick a category from the top menu or the **All Categories** menu. The left sidebar offers filters for price and every attribute linked to that category - for skin care: Skin Type, Skin Concern, Key Ingredient, Product Type and Formulation.

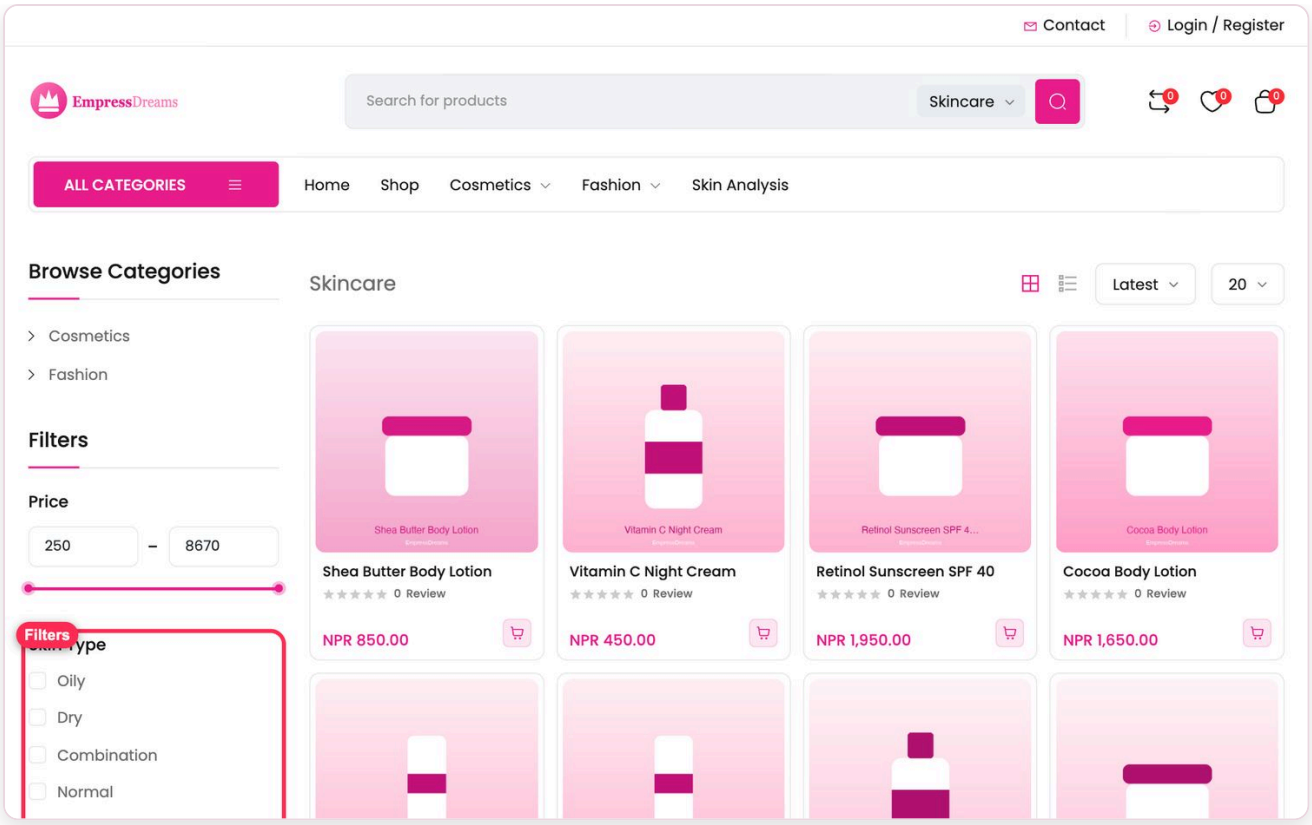

Figure 17. Skin care category with the attribute filters highlighted (1).

The search box at the top finds products by name and shows the most searched words to you in the admin dashboard.

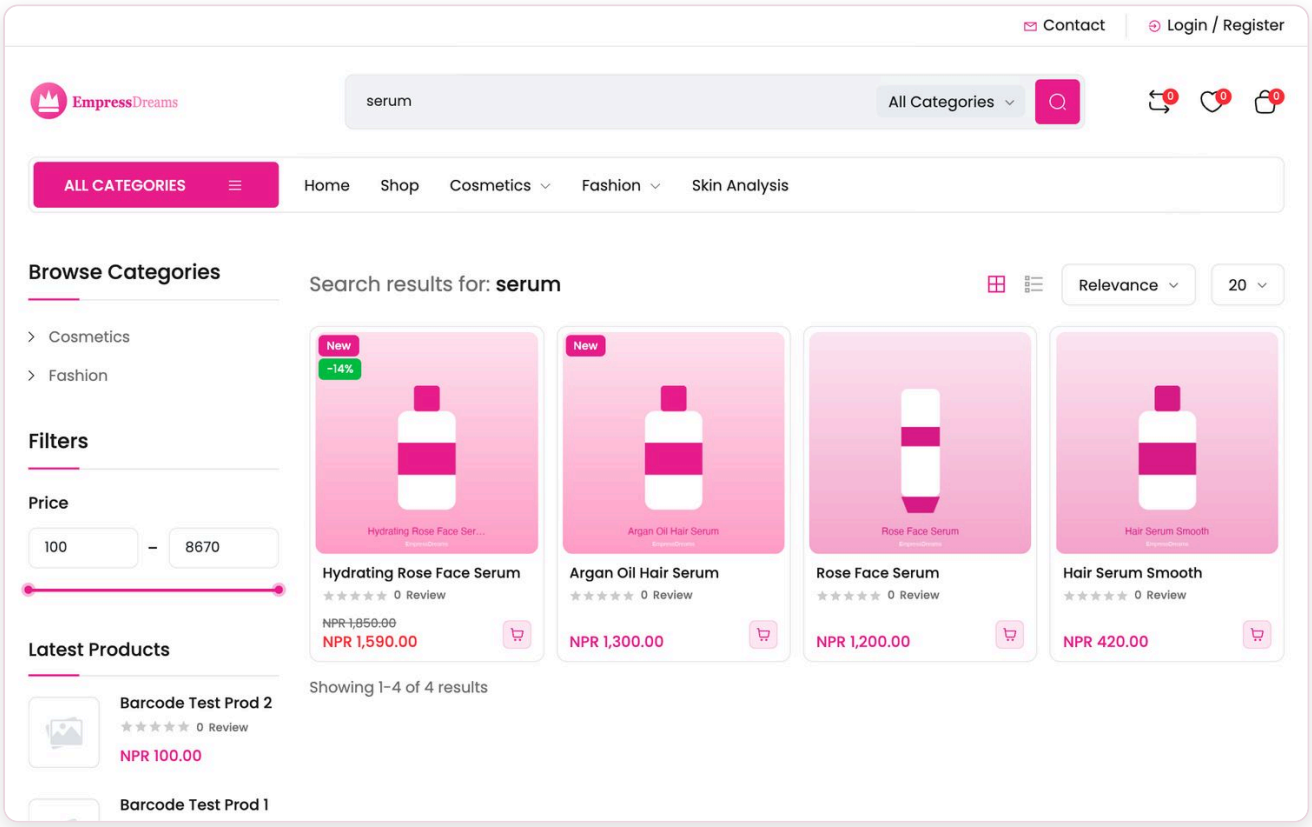

Figure 18. Search results.

5.3 Product page

The product page shows the gallery, price, availability, brand, wishlist and compare buttons. Products with variants show size buttons and colour swatches; the price and images update when a choice is made. A **Size guide** link appears when a chart is attached.

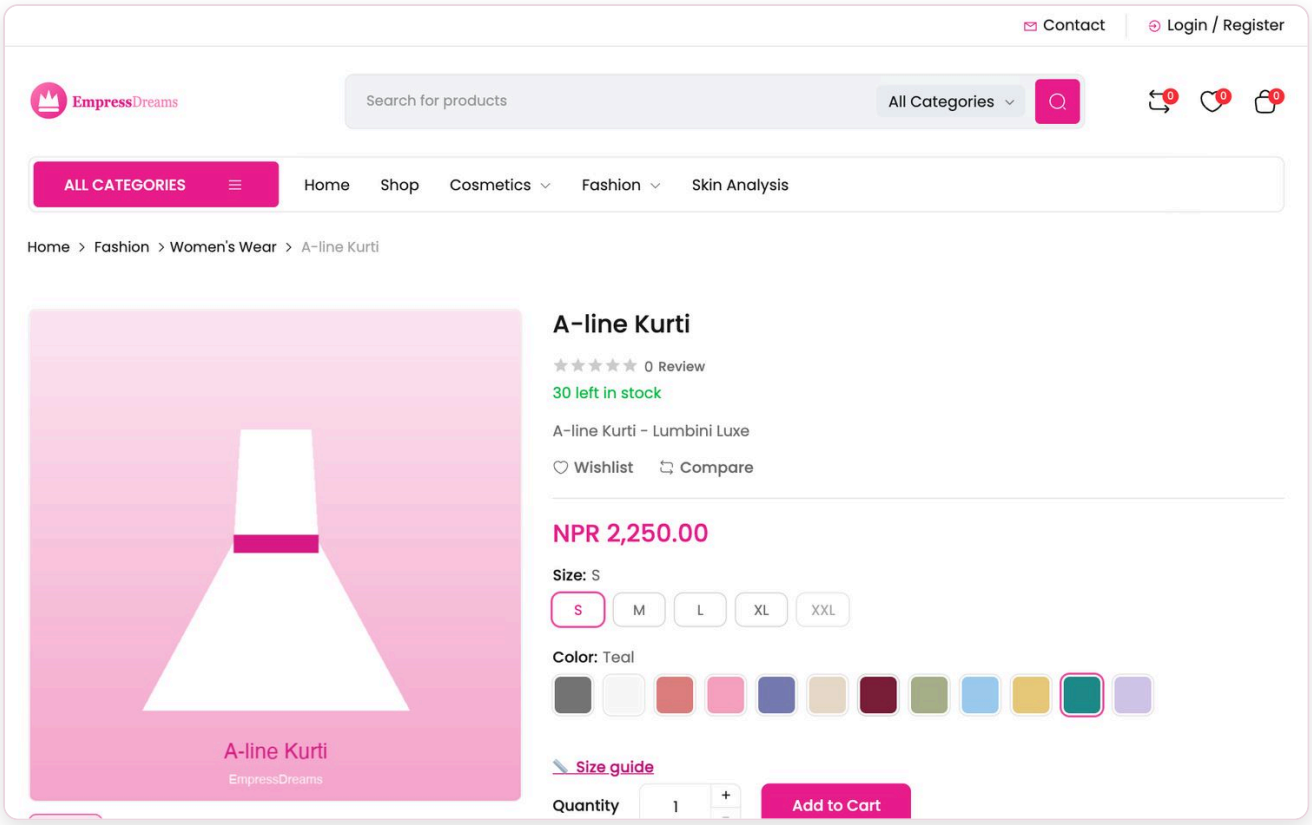

Figure 19. Variable product with sizes, colour swatches, size guide link and Add to Cart.

5.4 Cart and checkout

1. The customer adds items, then opens the **cart** and presses **Proceed to Checkout**.
2. Fills in billing details (or picks a saved address when logged in).
3. Chooses a shipping method, optionally enters a **coupon**, and optionally redeems **GlowPoints**.
4. Chooses a payment method: **Cash on Delivery**, **QR Payment** or **Direct Bank Transfer**.
5. Ticks the terms and presses **Place Order**.

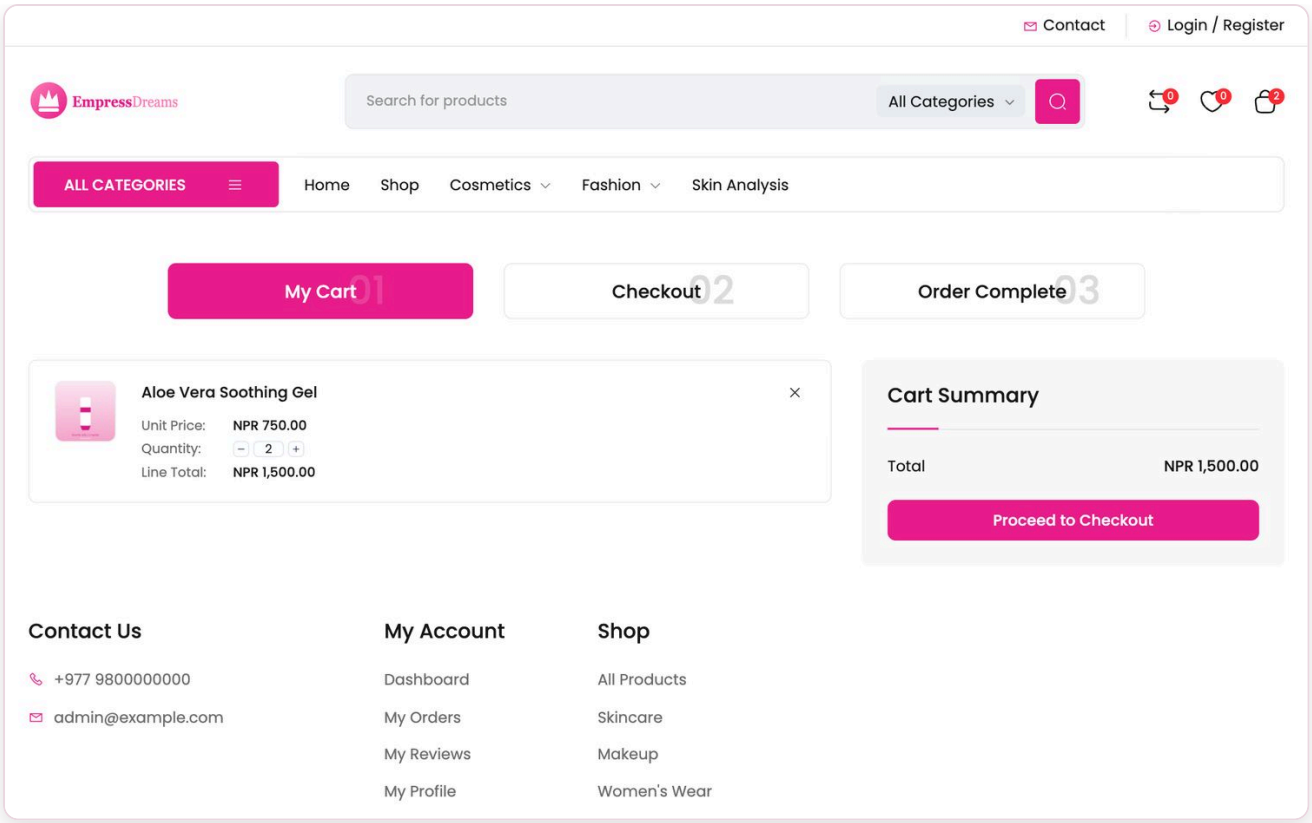

Figure 20. The cart page.

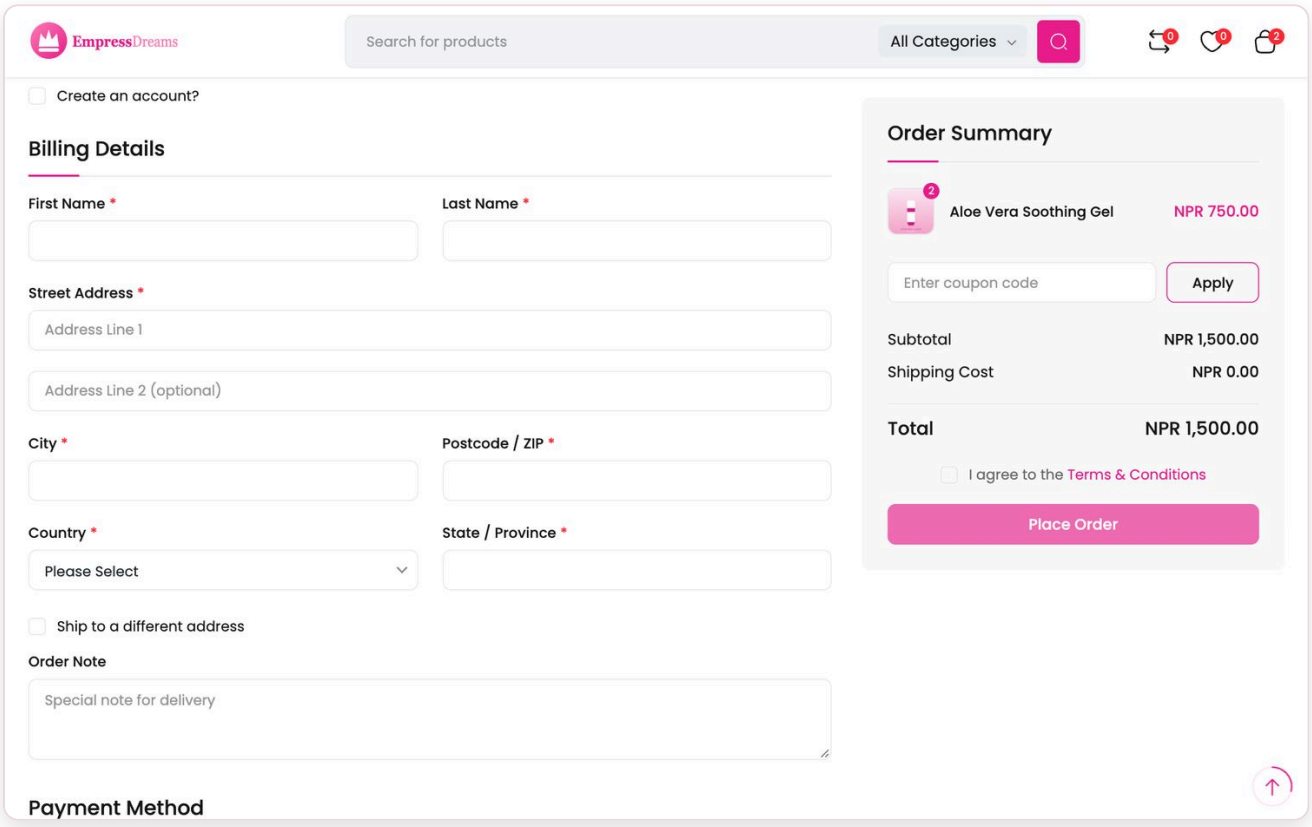

Figure 21. Checkout: the three payment methods; the bank details appear when Direct Bank Transfer is selected.

5.5 Customer account

Customers register on the store or during checkout. From **My Account** they can view recent orders, order details, addresses, their **GlowPoints** balance and saved **Skin Analysis** results.

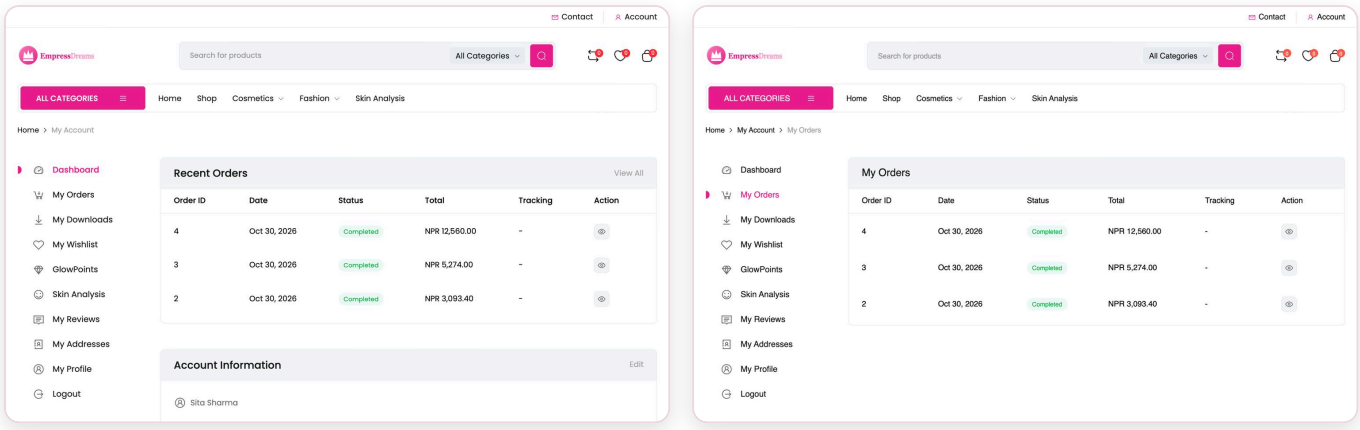

Figure 22. My Account dashboard and order list.

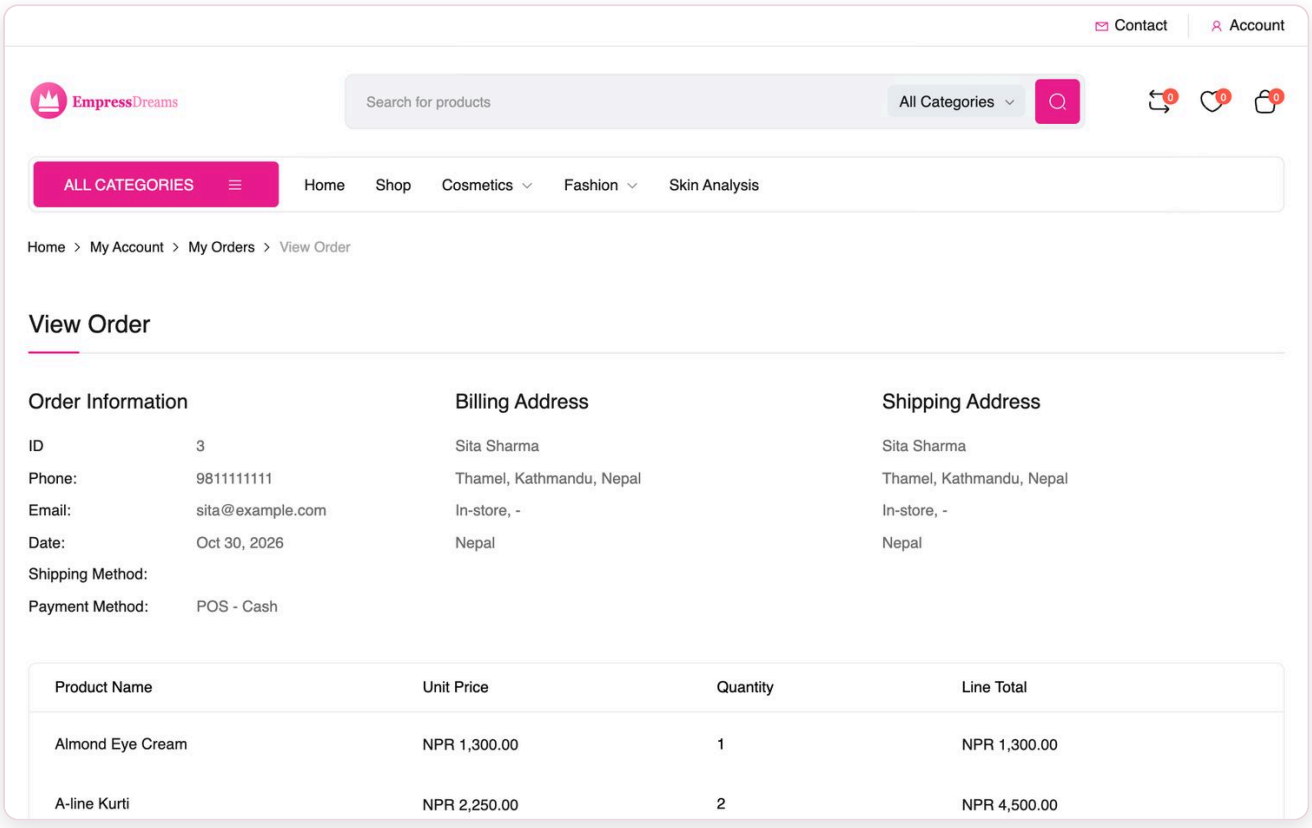

Figure 23. An order's details page.

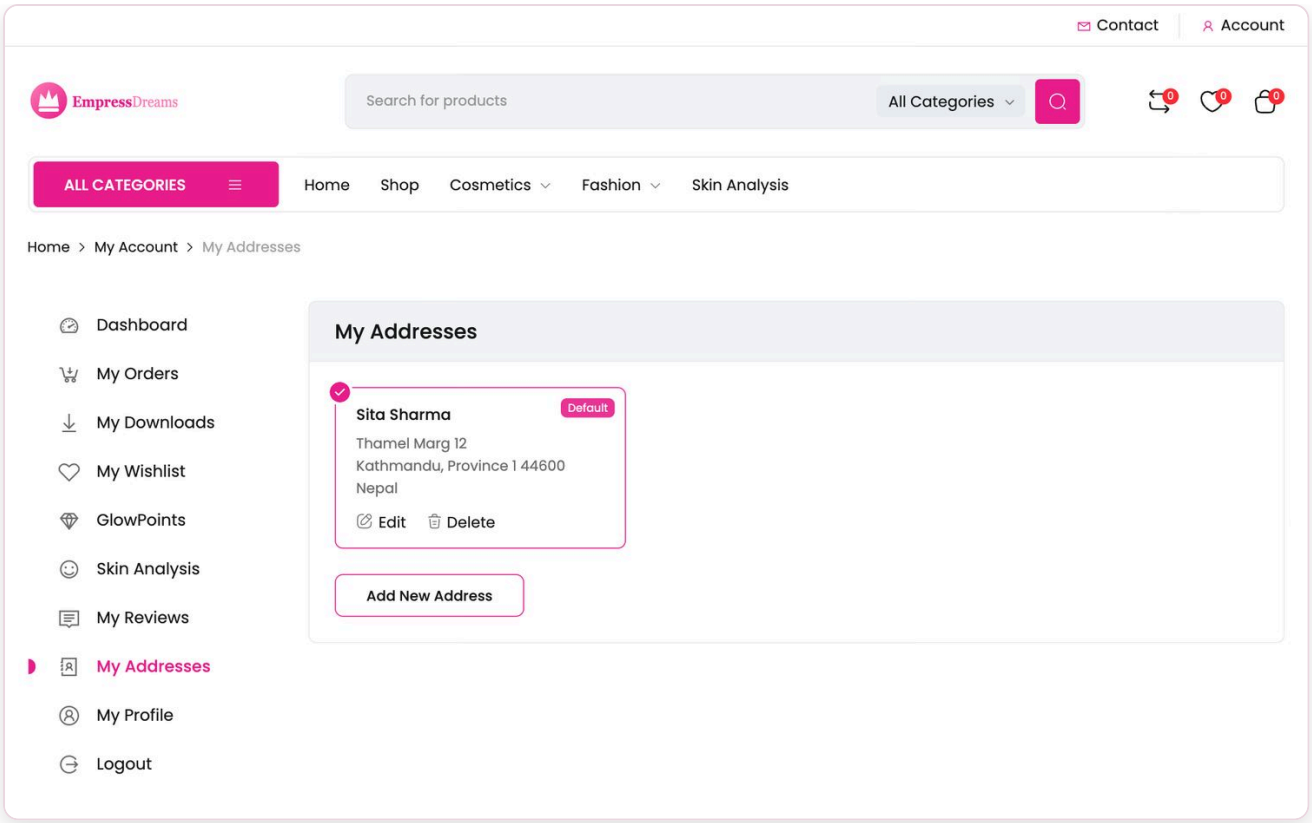

Figure 24. Saved addresses.

5.6 Using the store on a phone

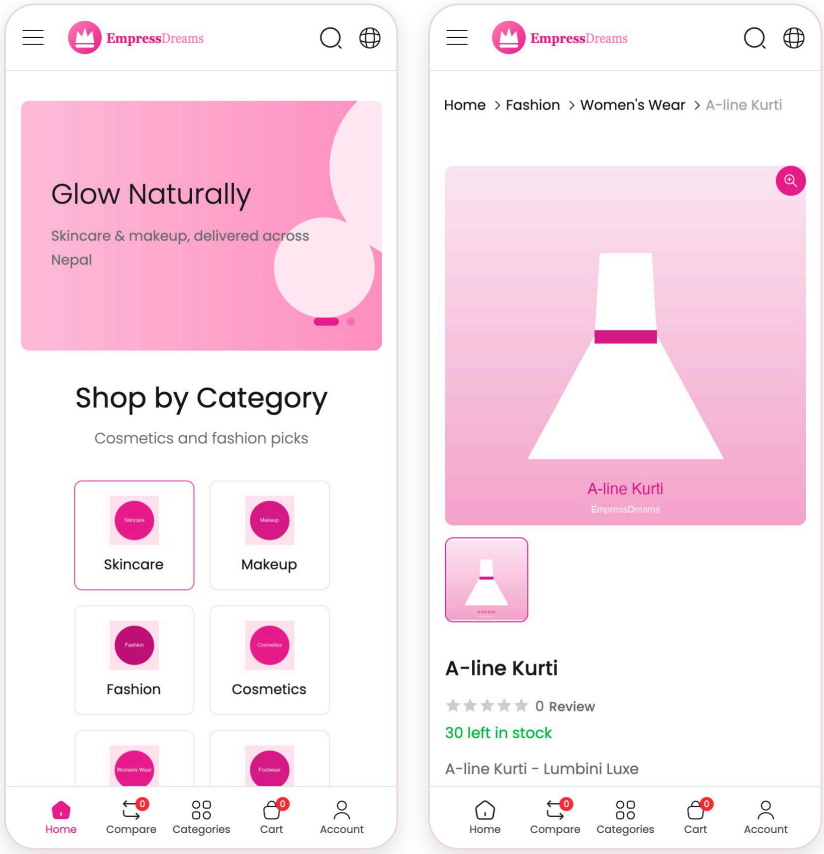

Figure 25. The store on a phone: home page and a product page with the bottom navigation bar.

CHAPTER 6

Orders and payments

Every web order and every POS sale becomes an order in the same list, so your reports are complete.

6.1 The orders list and order details

Open **Sales -> Orders**. The list shows ID, customer, status, total and date. POS sales appear too (their customer is shown as Walk-in Customer unless one was selected). Click a row to open the order.

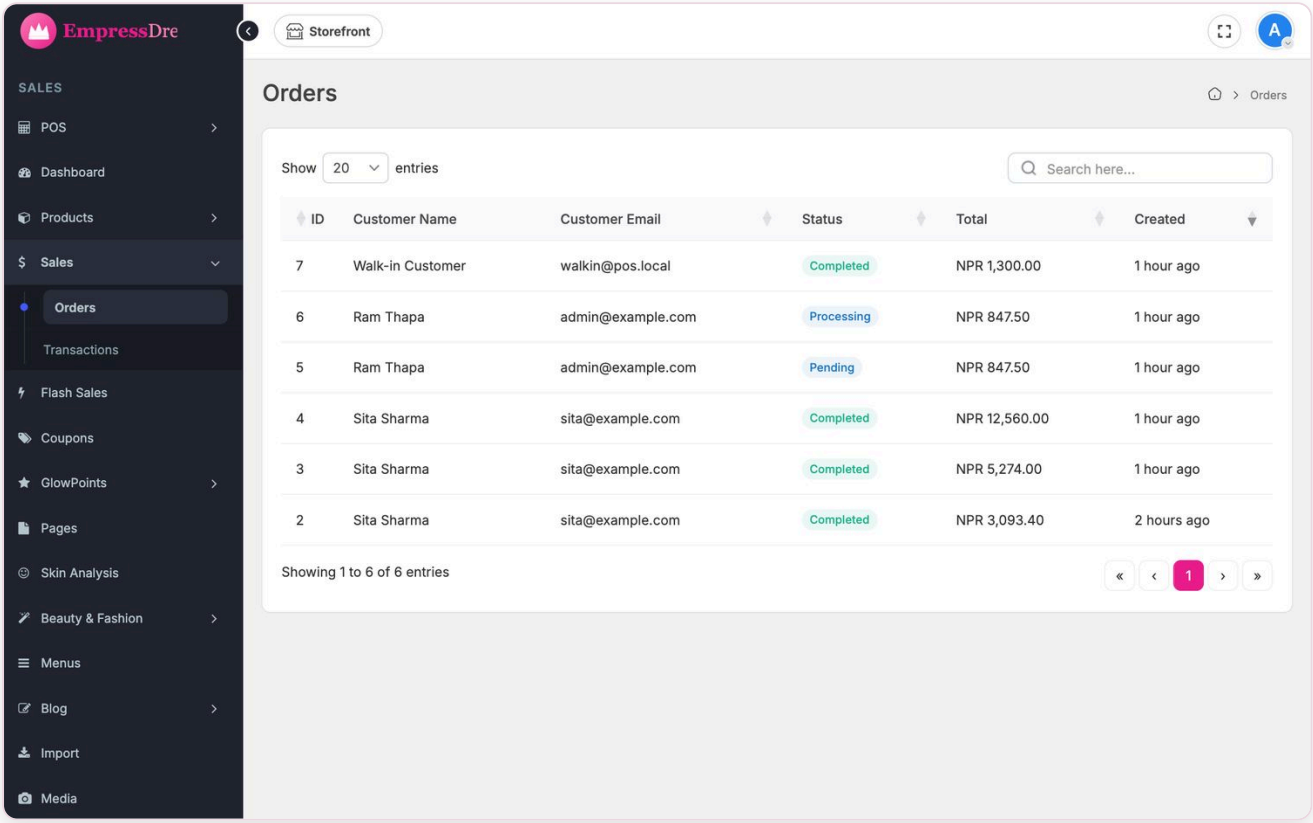

Figure 26. Orders list: web orders and POS sales together.

The order page shows tracking, customer and order information, addresses, items ordered and totals. The **Order Status** drop-down lets you move the order forward.

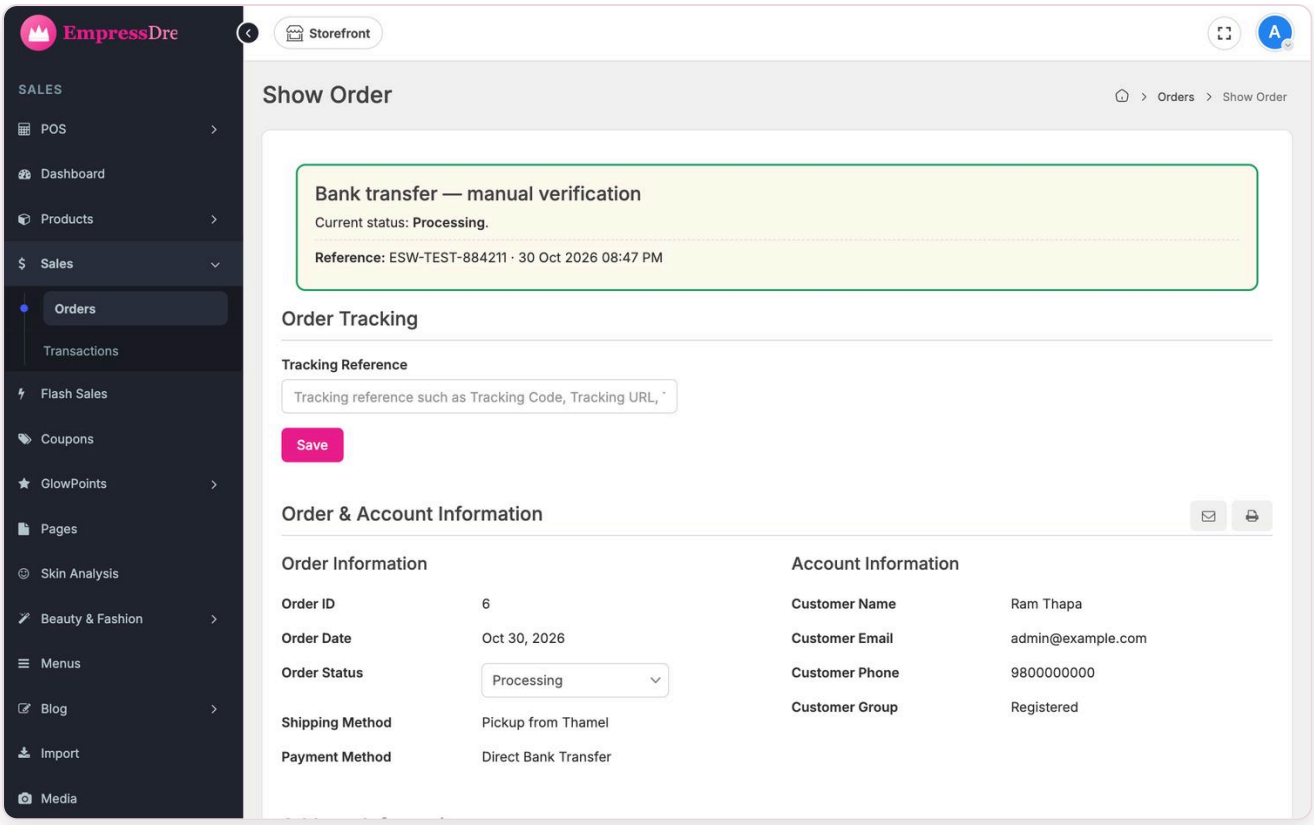

Figure 27. Order page for a Direct Bank Transfer order. The yellow box at the top is the manual verification panel.

6.2 Order statuses

Status	Meaning	Stock	GlowPoints
Pending Payment	Waiting for money (QR / bank transfer, or POS sale paid by QR/bank).	Reserved	Not yet earned
Pending	Order received (Cash on Delivery) and awaiting processing.	Reserved	Not yet earned
On Hold	Paused by you.	Reserved	No change
Processing	Payment confirmed / order being prepared or shipped.	Reserved	No change
Completed	Delivered and finished.	Sold	**Earned** (default setting)
Canceled	Order cancelled.	Returned to stock	Redeemed points refunded, earned points reversed
Refunded	Money returned.	Returned to stock	Same as Canceled

Pick the new status from the **Order Status** drop-down on the order page. It saves immediately and a confirmation message appears. The customer receives the normal status email (if mail is configured).

6.3 Cash on Delivery

The order arrives as **Pending**. Prepare it, set it to **Processing** when it is shipped, collect cash on delivery, then set **Completed**.

6.4 Verifying QR and bank-transfer payments

QR Payment and Direct Bank Transfer are checked **manually** by you. The system never marks them paid by itself.

1. The customer places the order and sees the QR code or your bank details. The order status is **Pending Payment**.
2. The customer pays, then enters their **transaction / reference number** (and optionally a screenshot) in the form on the order-complete page or under **My Account -> My Orders -> the order**.
3. You open the order in the admin. The **manual verification** box shows the reference, time, note and screenshot.
4. Check your bank statement or wallet for the exact amount.
5. If the money arrived, change the status to **Processing** (or **Completed**). If it never arrives, set **Canceled**.

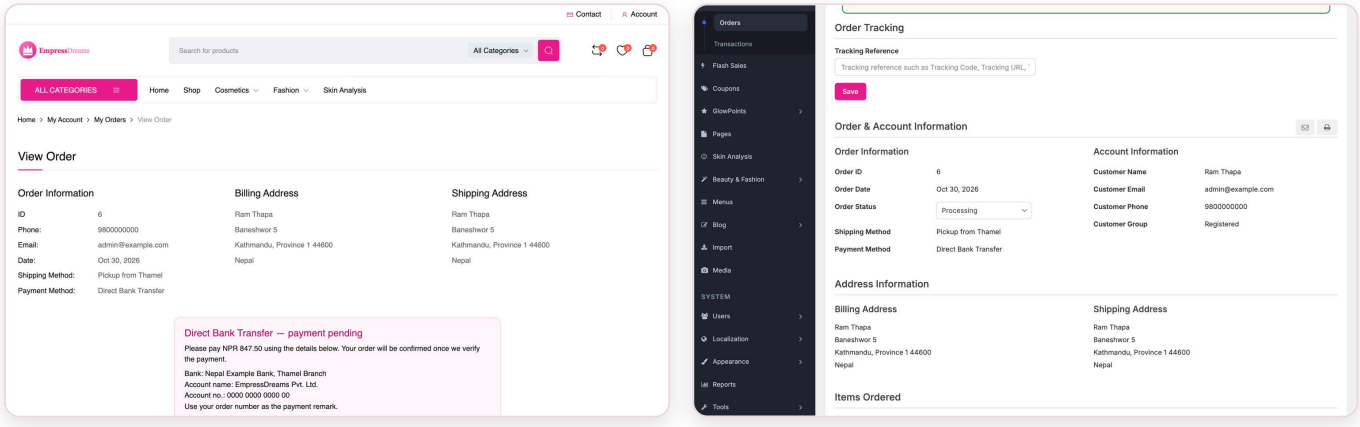

Figure 28. Customer submits payment proof (left); admin changes the status after verifying (right).

> **IMPORTANT**
> Always compare the
> **AMOUNT**
> and
> **REFERENCE**
> with your bank record. A screenshot alone is not proof of payment.

6.5 Payment method settings

Open **Settings -> Payment Methods**. Each method has its own tab with an on/off switch, a label and description shown at checkout.

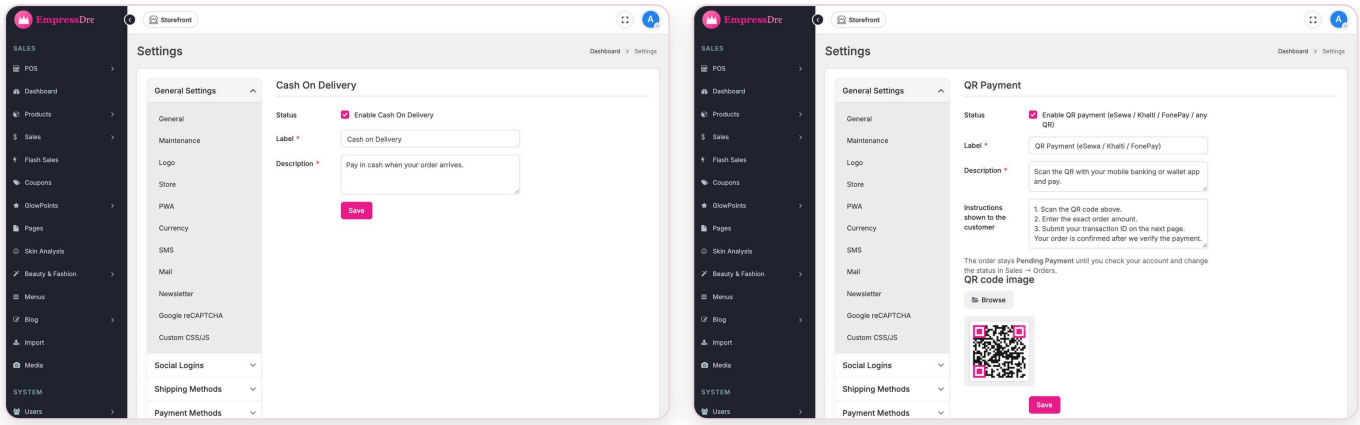

Figure 29. Cash on Delivery and QR Payment settings.

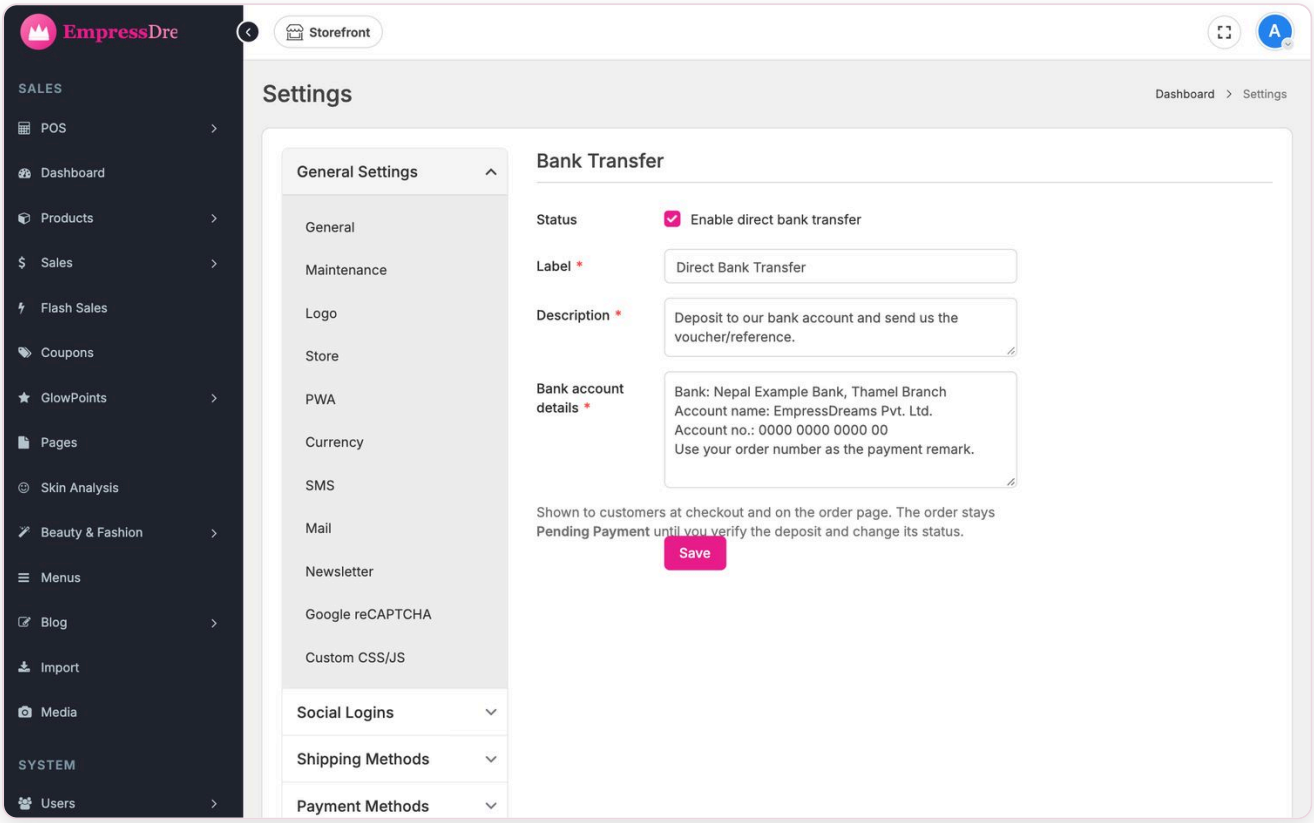

Figure 30. Direct Bank Transfer settings: enter your real account details.

> **IMPORTANT**
> QR Payment and Bank Transfer are turned **OFF** on the live store until you enter your real QR image and bank details. Do not enable them with sample details.

6.6 Shipping, tax and currency

- **Shipping methods** (Settings -> Shipping Methods): Free Shipping (with a minimum amount), Local Pickup and Flat Rate (the cost for delivery within Nepal).
- **Tax**: Products -> Taxes holds the **Nepal VAT** class (13%). Products using that class show VAT at checkout. The POS has its own tax setting (Chapter 8).

- **Currency**: Settings -> Currency. The default and only currency is **NPR**; rates are under Localization -> Currency Rates.

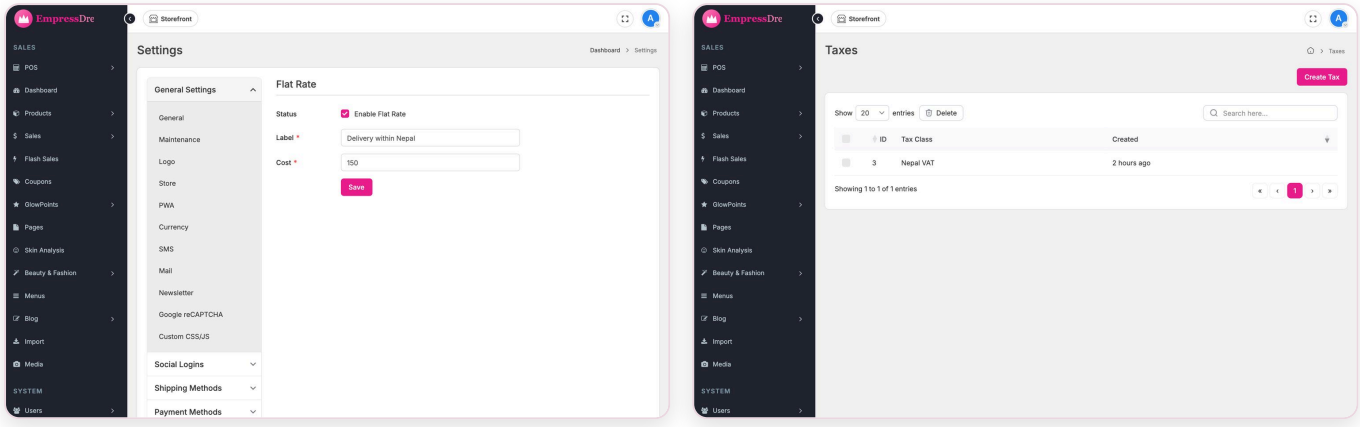

Figure 31. Flat-rate shipping and the tax list.

6.7 Coupons

1. Go to **Coupons -> Create Coupon**.
2. Fill in the name and a unique **code**, choose **Fixed** or **Percent** and the value, optionally **Free shipping**.
3. On **Usage Restrictions** set minimum/maximum spend and include or exclude products and categories.
4. On **Usage Limits** set how many times the coupon can be used in total and per customer.
5. Set start/end dates and tick **Status** to enable it.

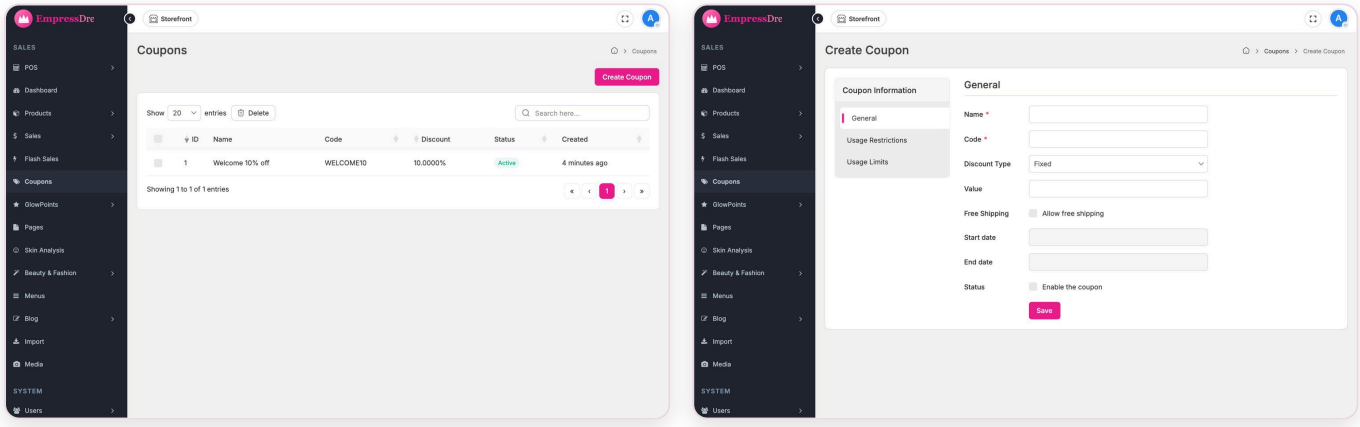

Figure 32. Coupon list and the create form.

Customers enter the code on the checkout page next to **Apply**. Flash Sales (Flash Sales menu) are separate: they put selected products on a timed special price.

6.8 Reports

Reports gives coupon, customer order, product view, sales, shipping, tax and search reports. Choose the report type and date range on the right and press **Filter**. Amounts use the default currency (NPR).

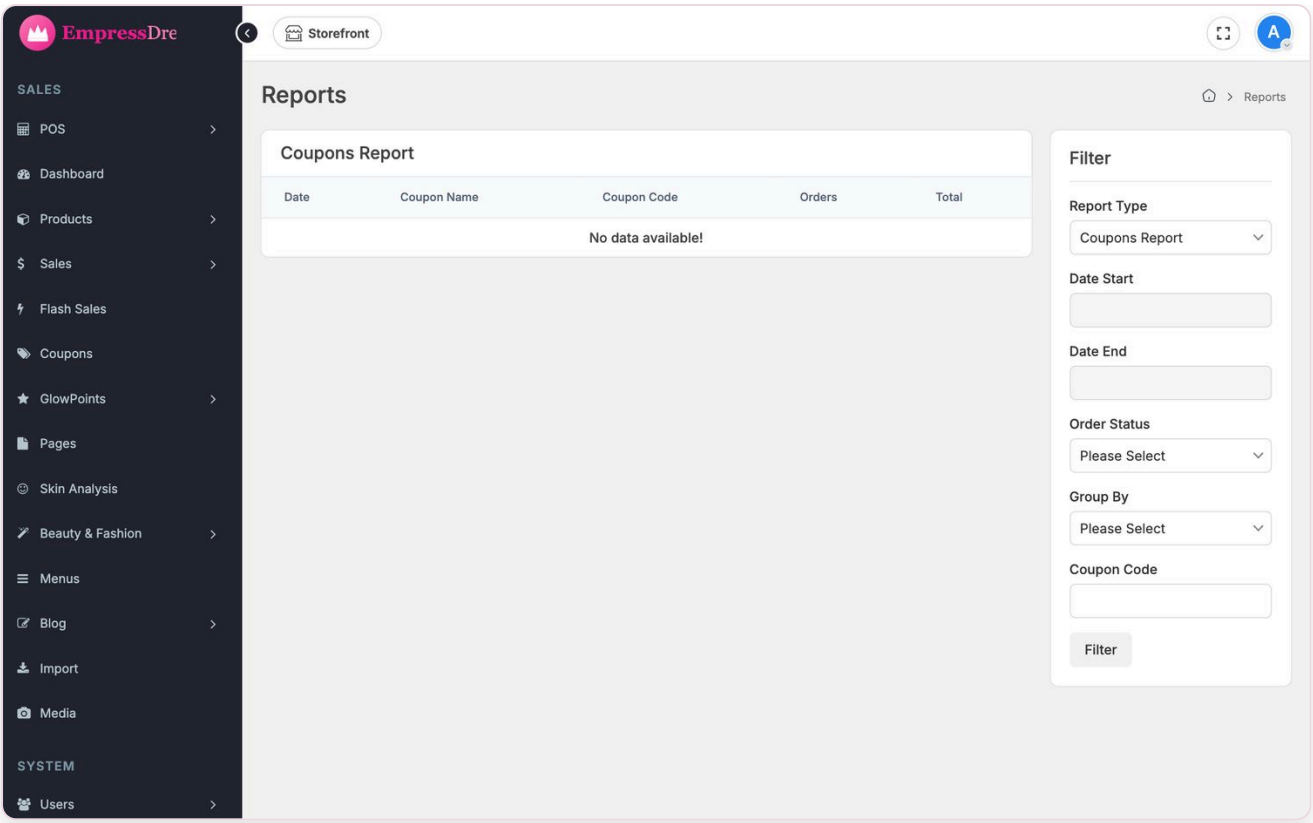

Figure 33. Reports page with the filter panel.

CHAPTER 7

POS - the in-shop till

The POS is a full point-of-sale for cosmetics, skin care and fashion shops. It works on desktops, tablets and phones, supports barcode scanners and prints 80 mm receipts.

7.1 What you need

- A device with a modern browser (Chrome, Edge, Brave or Safari): desktop, tablet or phone.
- **Optional:** a USB or Bluetooth barcode scanner (acts like a keyboard), or just use the camera.
- **Optional:** an 80 mm thermal receipt printer.
- A logged-in admin or staff user. Open https://empressdreams.com/admin/pos.

7.2 Opening the cash register

Before you can sell, open a register with your **opening cash** (the money already in the drawer). The terminal asks automatically when you open it.

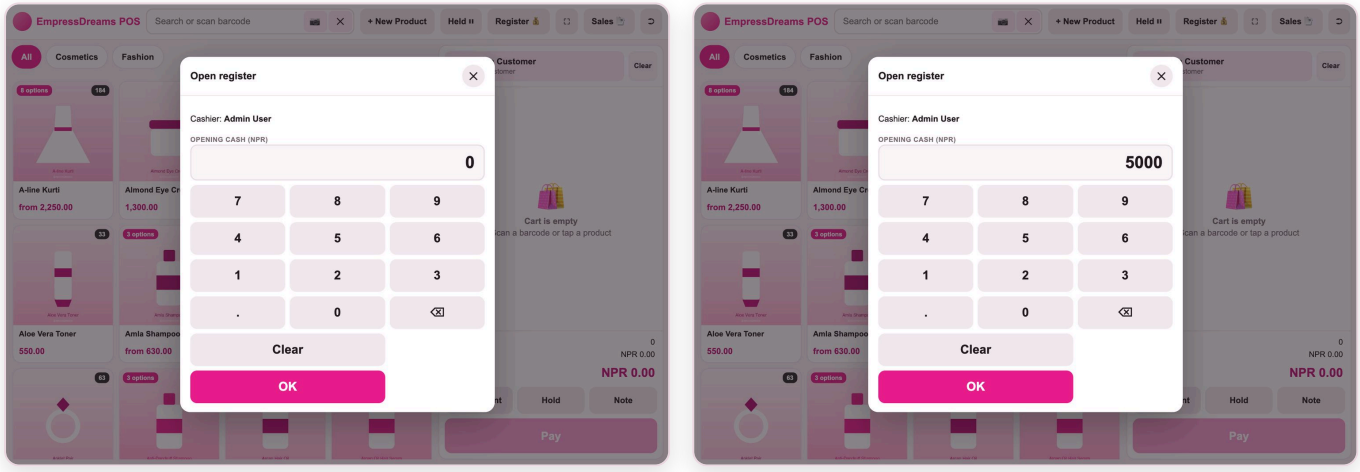

Figure 34. Open register: type the opening cash with the on-screen keypad and press OK.

7.3 Screen tour

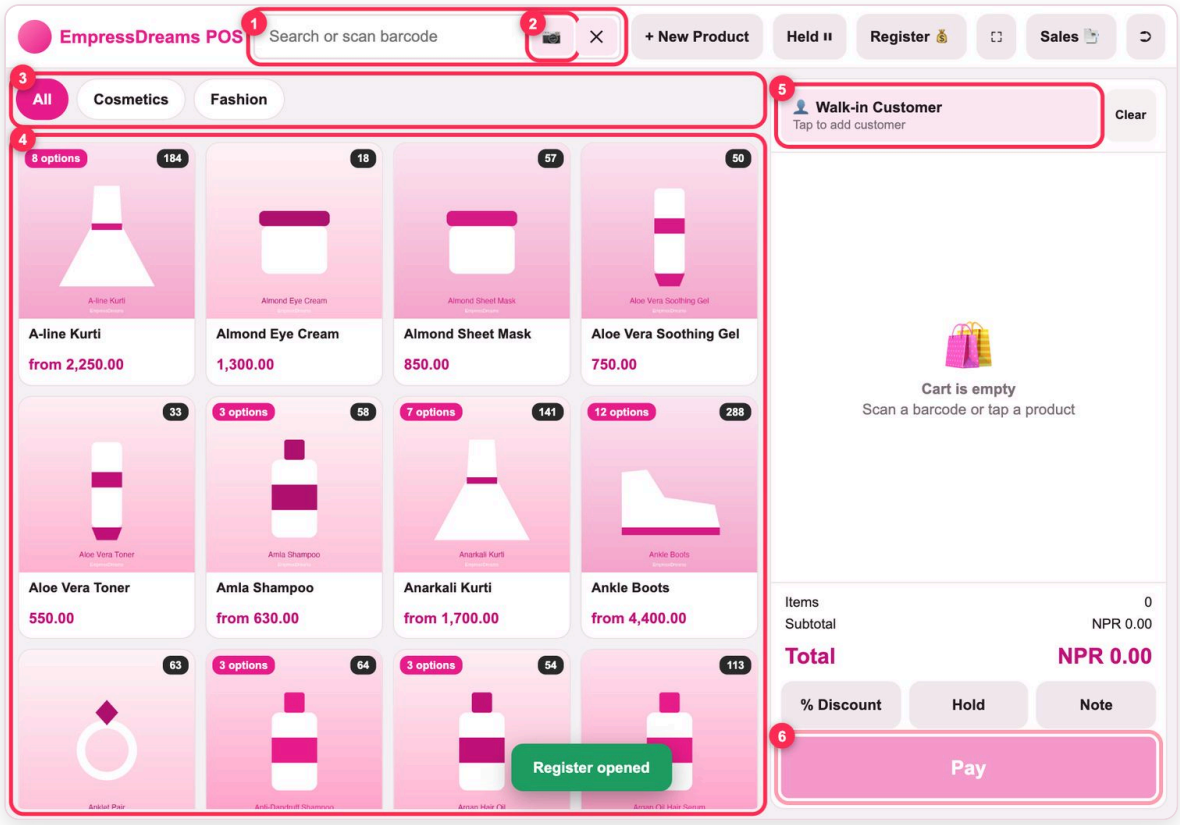

Figure 35. POS terminal on a tablet. 1 Search/scan box, 2 Camera scan, 3 Category chips, 4 Product grid, 5 Customer, 6 Pay button.

Area	What it does
Search / scan box	Type a name or SKU, or scan a barcode and the item is added. Shortcut **F2**.
Camera button	Scan a barcode with the device camera.
+ New Product	Add a simple product on the spot (scan its barcode).
Held	Bills you parked to serve someone else (badge shows the count).
Register	Cash in/out, summary and closing.
Sales	Opens the sales history and returns page.
Category chips	Filter products; a second row shows sub-categories.
Product cards	Tap to add. Cards show stock, "options" for variable products and SALE tags.
Cart panel	Quantity buttons, **Disc** (line discount), **Price** (price override, if allowed), delete, totals.
% Discount / Hold / Note	Bill discount, park the bill, add a note.

7.4 Selling an item

By barcode

Scan the product's barcode. It is added to the cart with a beep. Scanning the same barcode again increases the quantity. Variants have their own barcodes, so scanning a size/colour label adds that exact variant.

By touch or search

Tap a product card. For products with options (sizes, colours, shades) a picker opens: tap one or several variants and close the picker when done.

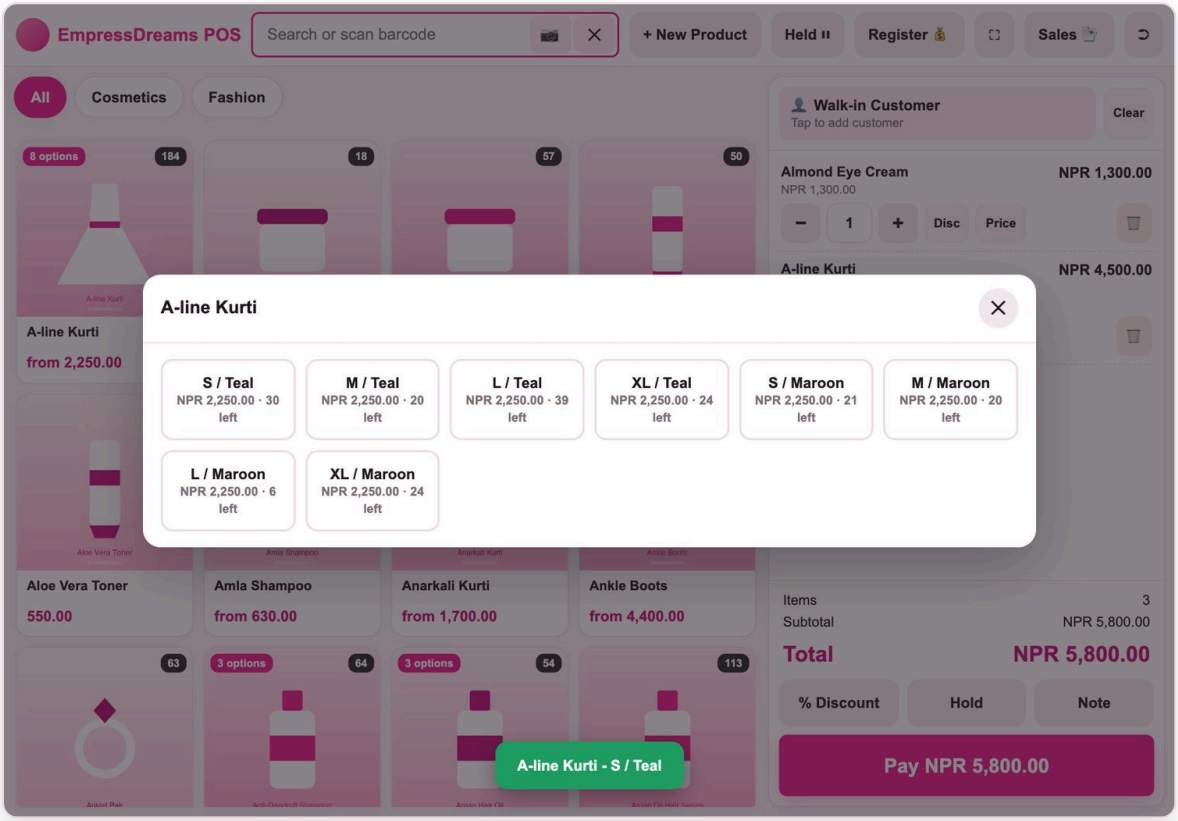

Figure 36. Variant picker for a kurti: each size/colour shows its price and remaining stock.

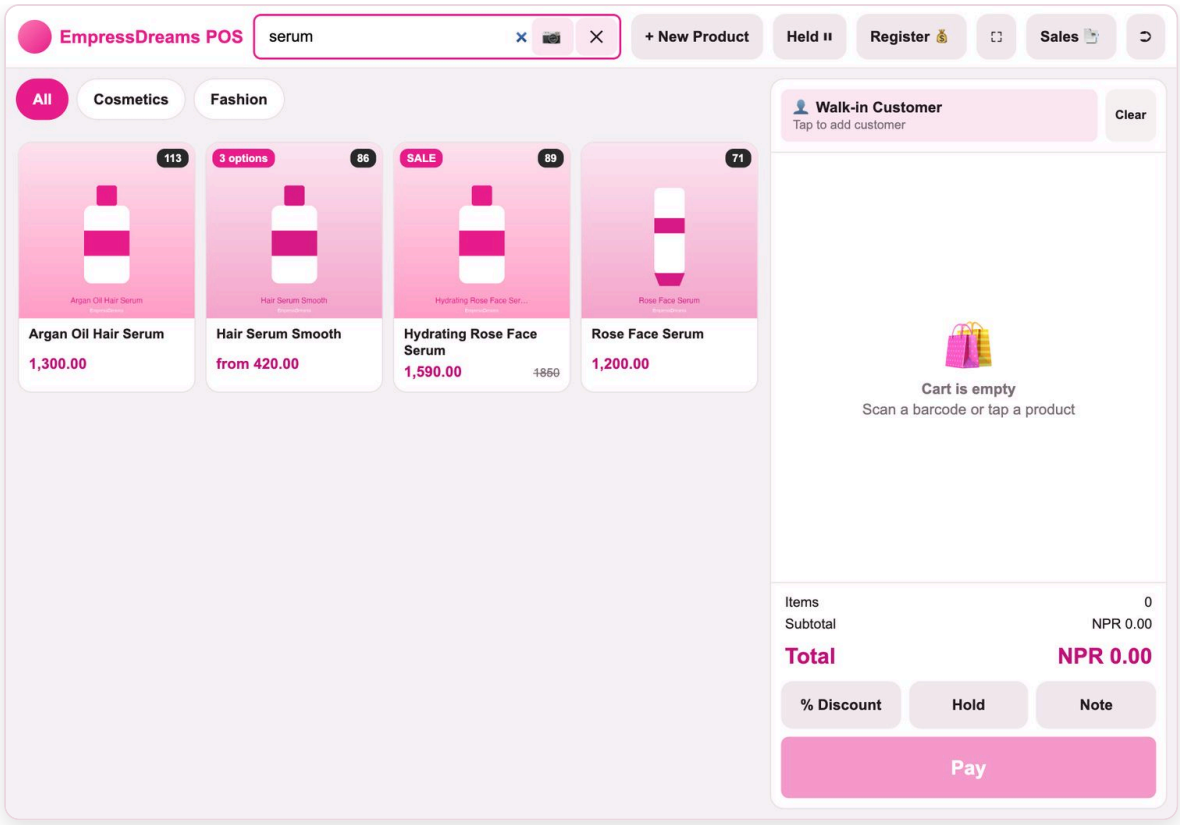

Figure 37. Searching for "serum" filters the grid instantly.

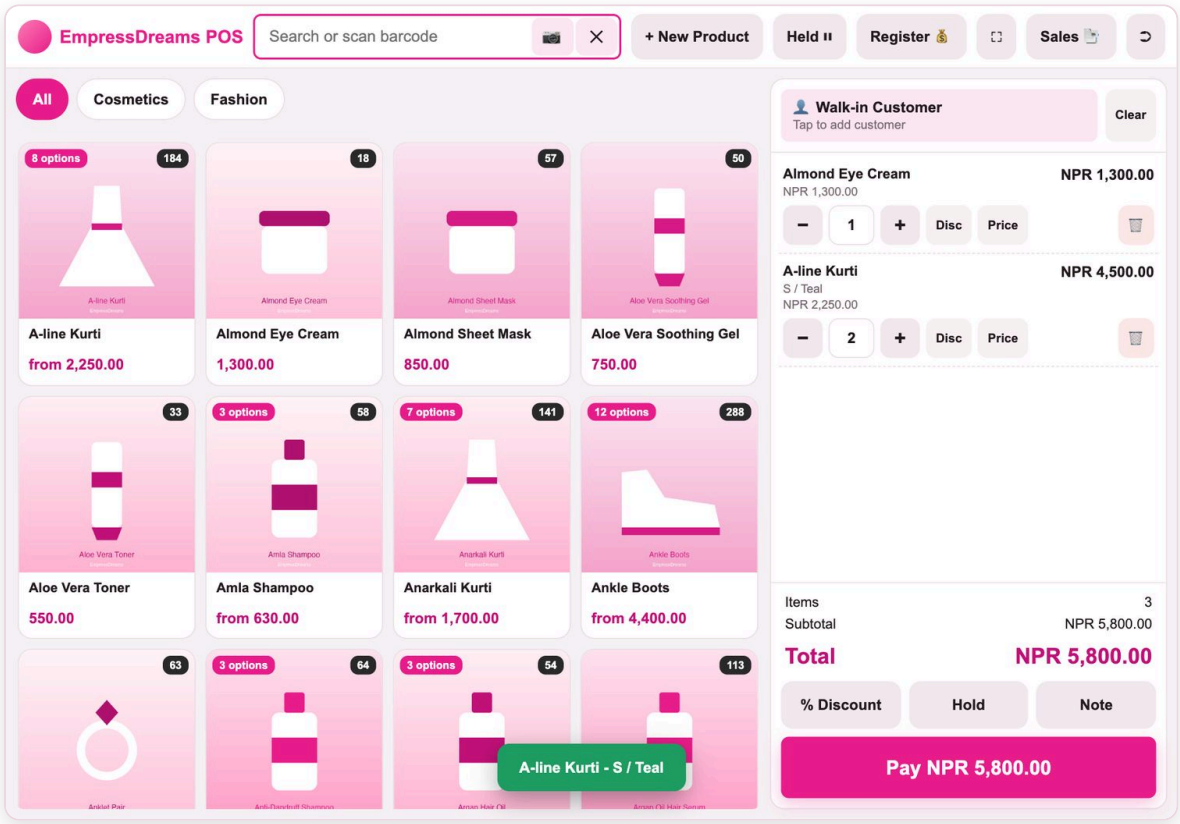

Figure 38. Cart with a simple product and two variants, totals and the Pay button.

Changing quantity, price or discount

- Tap **+** / **-**, or tap the quantity number to type it with the keypad.

- **Disc** gives a money discount on that line.
- **Price** overrides the unit price (only if "Allow cashier to change unit price" is enabled in POS Settings).
- The bin icon removes the line.

7.5 Customers and GlowPoints

Tap the **customer** button at the top of the cart to attach a customer by name or phone, or add a new one (name and phone are enough). When a customer with enough GlowPoints is selected, the terminal offers to use them.

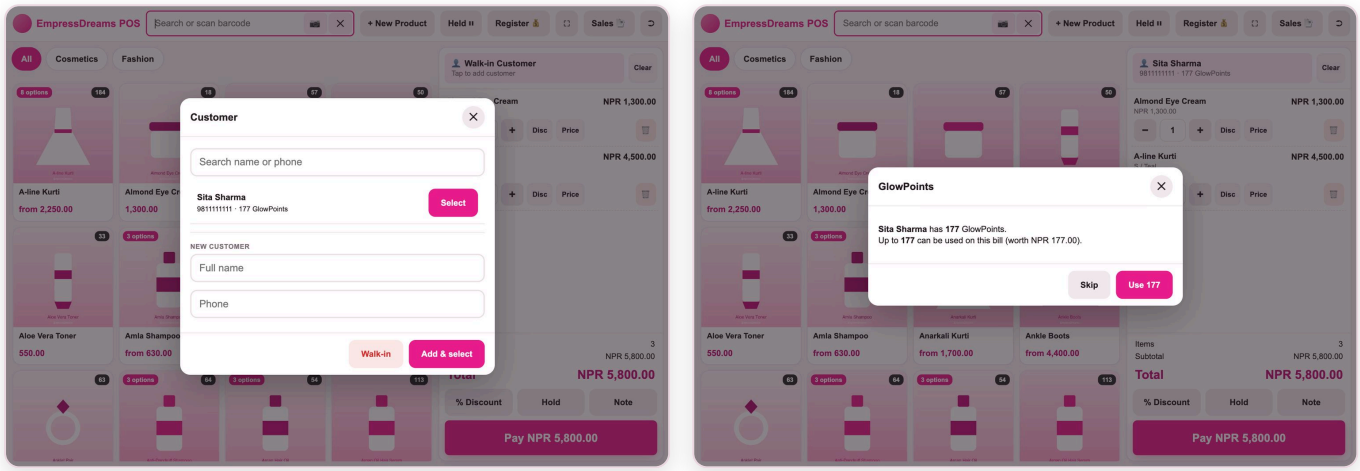

Figure 39. Choose or add a customer; the terminal offers to redeem their GlowPoints.

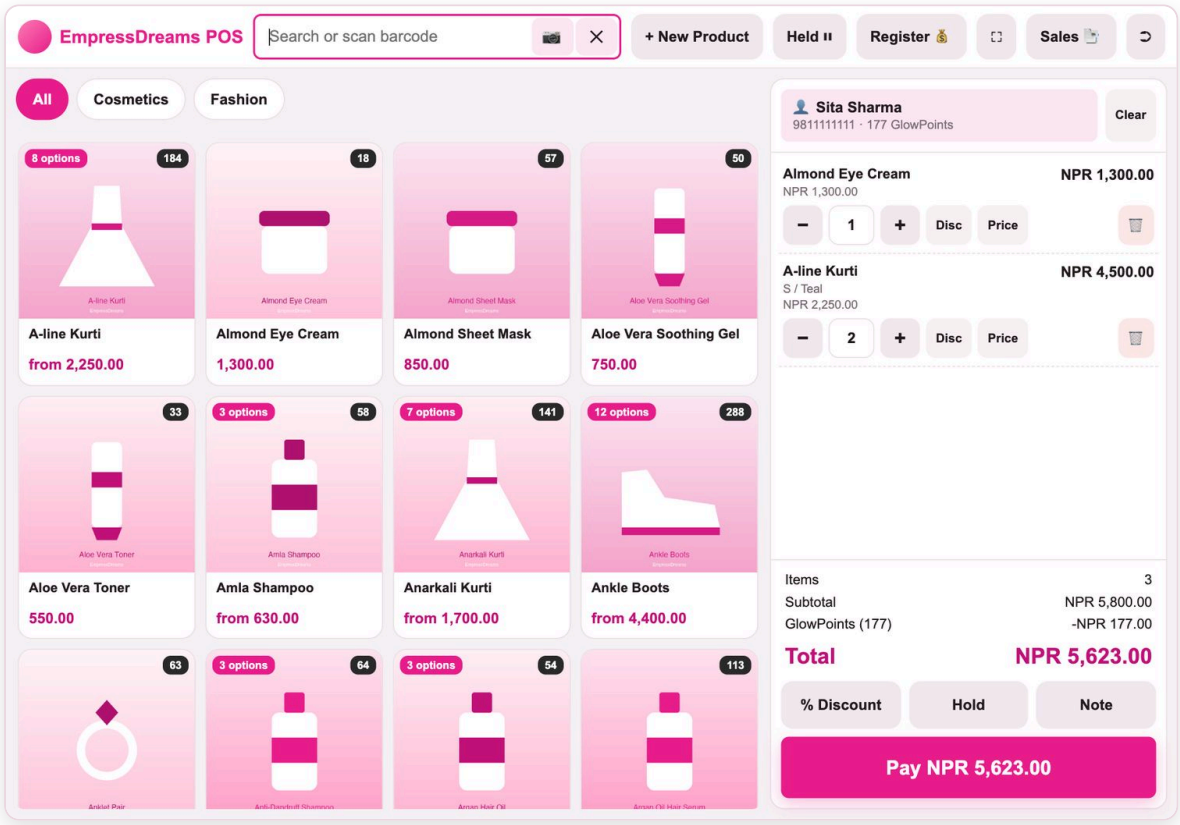

Figure 40. Customer attached and GlowPoints discount applied to the total.

NOTE

Points can pay up to the percentage set in GlowPoints settings (default 50% of the bill) and need the minimum redemption (default 100 points). The customer earns new points when the sale is completed.

7.6 Bill discounts

Tap **% Discount**. Choose **Percent** or **Amount**, tap a quick button (5-30%) or type a value on the keypad, then **OK**. Use **Remove** to cancel.

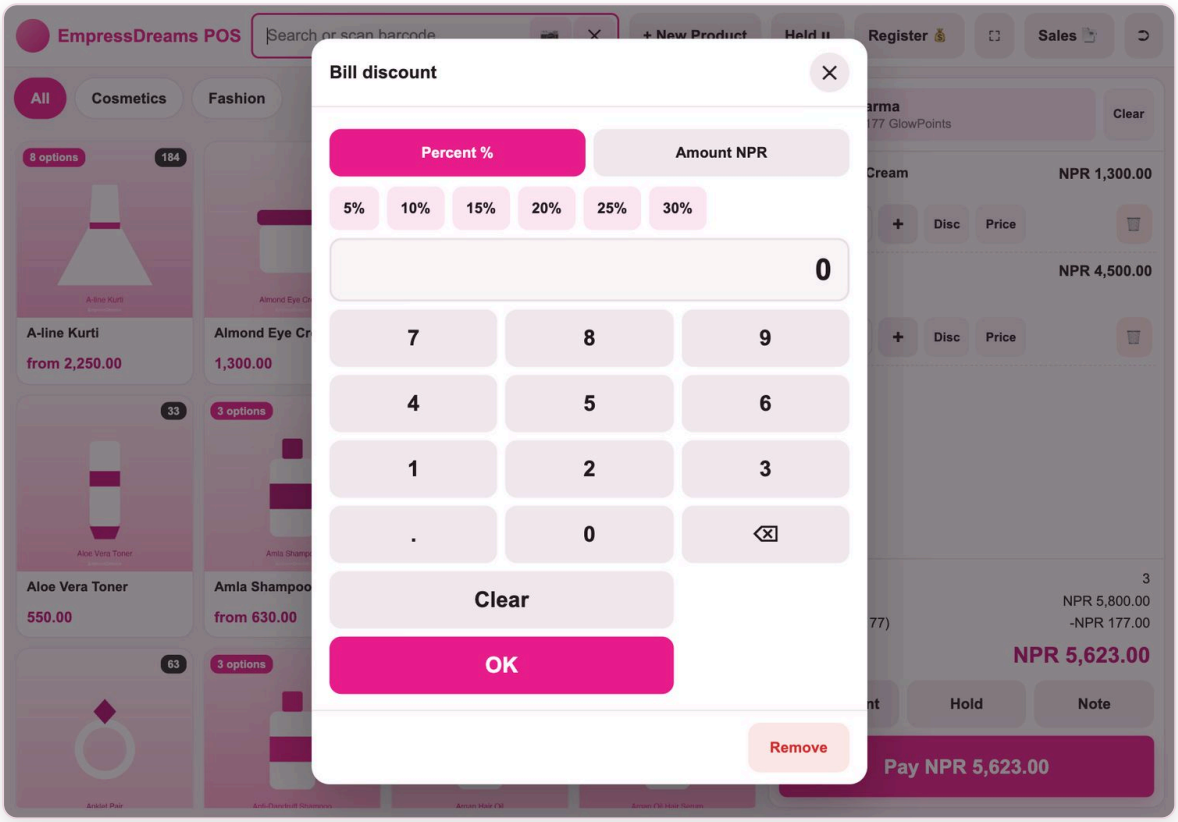

Figure 41. Bill discount dialog.

7.7 Taking payment

Press **Pay**. The payment dialog shows the total, what is paid so far and what remains.

Method	How it works
Cash	Tap **Exact** or a suggested note (for example 5000), then **Add Cash payment**. The change due is shown and printed. Only cash can produce change.
Card	Add the amount (and optional approval number) after the card machine approves.
QR Payment	Add the amount and the wallet transaction reference. The bill stays **Pending** until you verify it.
Bank Transfer	Add the amount and the bank voucher reference. The bill stays **Pending** until you verify it.

Method	How it works
Split	Add several payments (for example 1,000 cash + the rest by QR). The payment list shows each one; the sale can be completed when the total is covered.

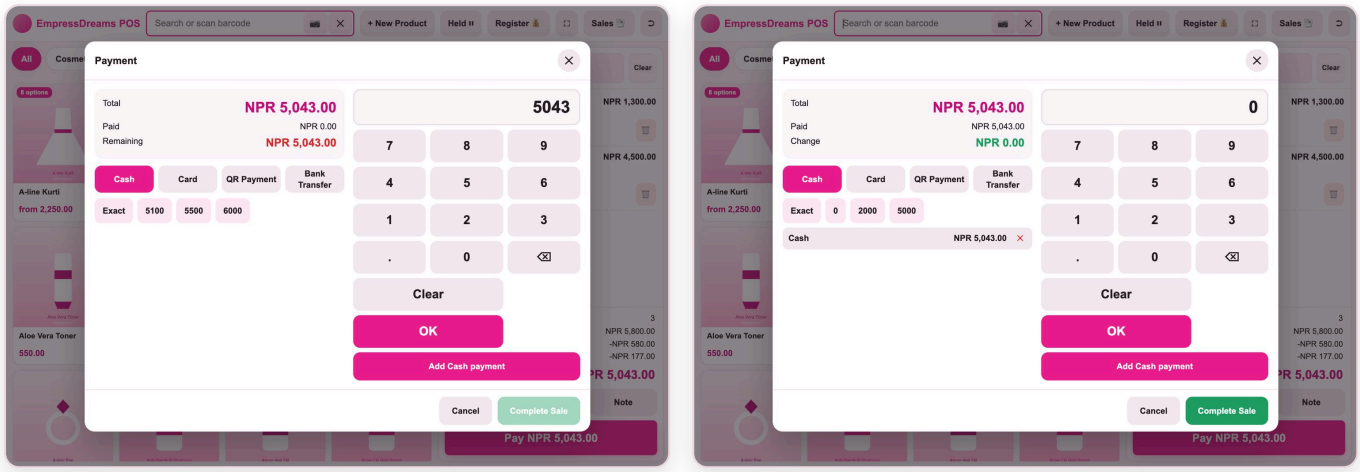

Figure 42. Cash payment: choose Exact or a note, then Add Cash payment; Complete Sale lights up when paid in full.

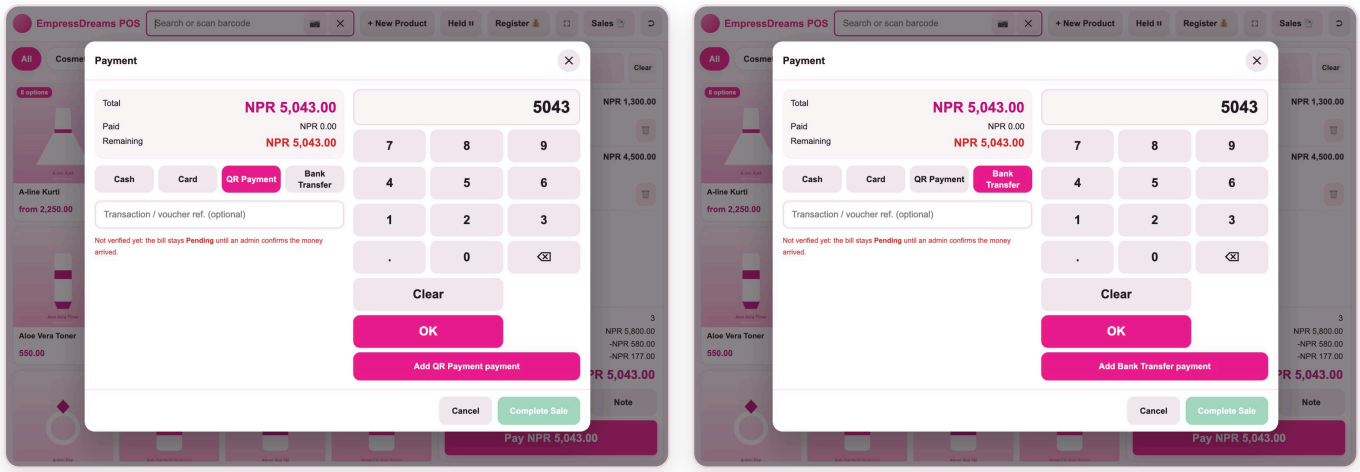

Figure 43. QR and Bank Transfer ask for a reference and warn that the bill stays Pending until verified.

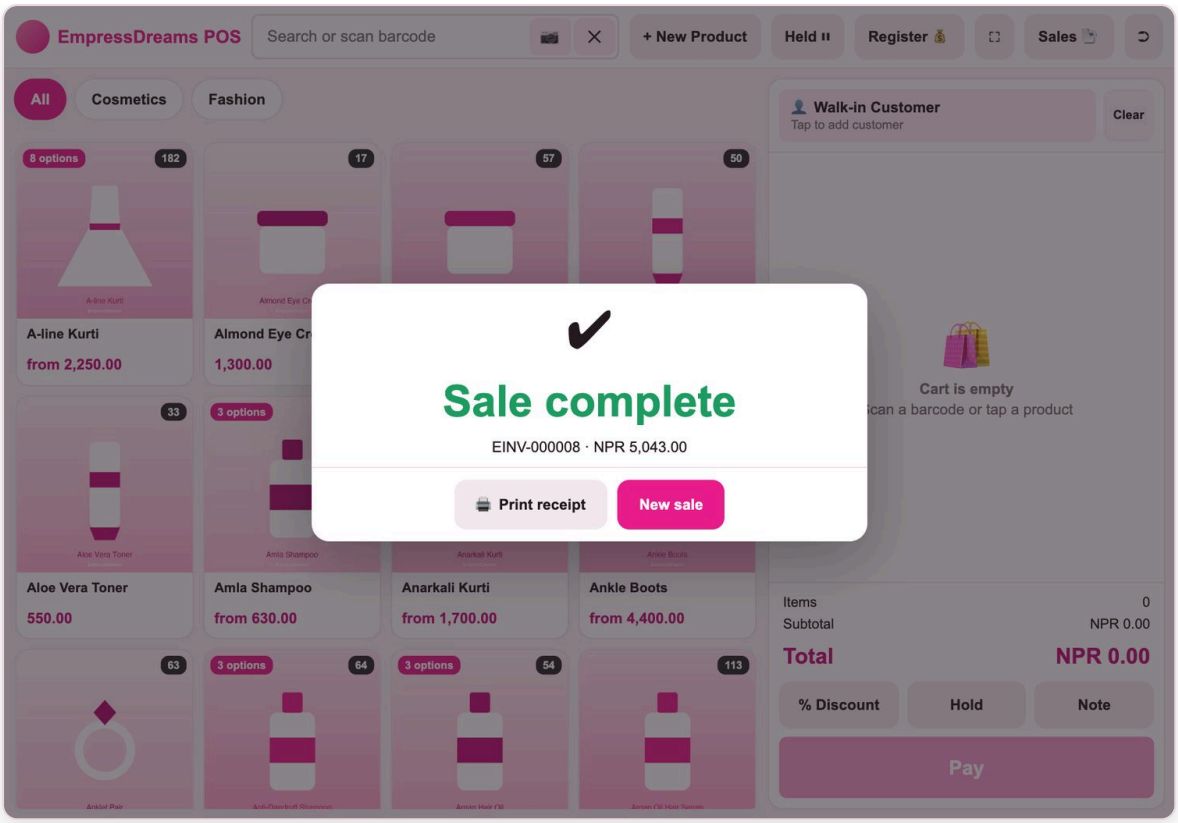

Figure 44. Sale complete: shows the bill number, total and change due. Press Print receipt or New sale.

7.8 QR and bank payments in POS: verifying them

Sales paid (even partly) by QR or bank are saved with status **Pending Payment**. They reduce stock straight away but do **not** award GlowPoints until you verify.

1. Open **POS -> Sales & Returns**.
2. Rows awaiting payment show **Awaiting verification** and a green **Verify payment** button.
3. Check your bank/wallet, then press **Verify payment** and confirm. The order becomes **Completed** and GlowPoints are awarded.
4. If the money never arrives, open the order in **Sales -> Orders** and set it to **Canceled** to return the stock.

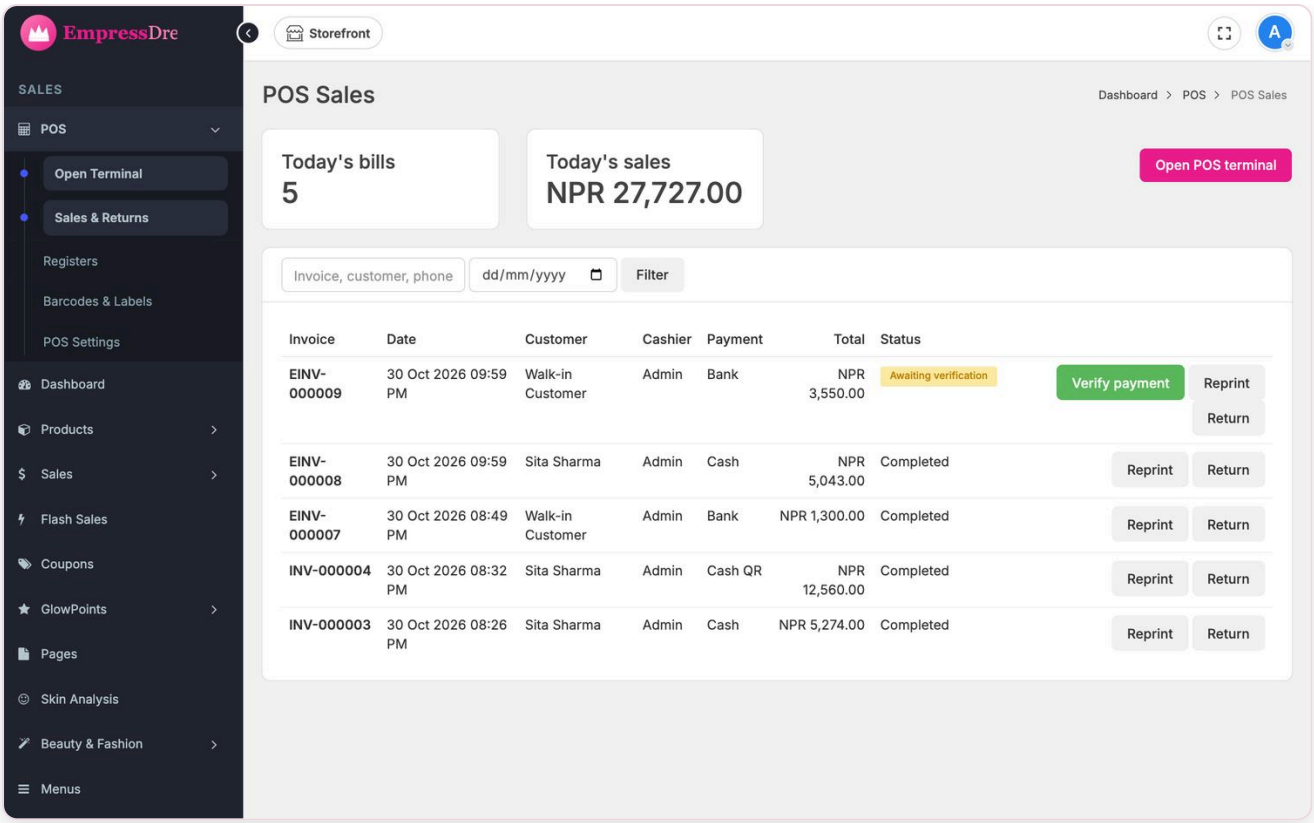

Figure 45. Sales & Returns: today's totals, verification buttons, reprint and return.

7.9 Printing 80 mm receipts

Receipts are designed for 80 mm thermal paper (58 mm is also supported in POS Settings). Everything on the bill is dynamic: your business name, address, phone, PAN/VAT number, the bill number and date, cashier, customer, every item with its variant, discounts, VAT, payments, change, GlowPoints earned and balance, a bill barcode and your footer text.

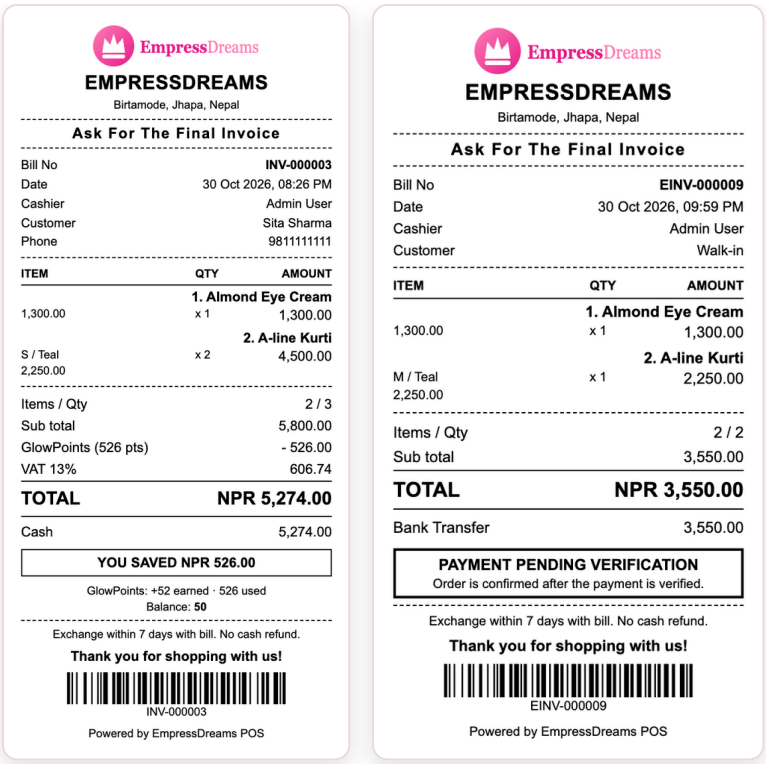

Figure 46. A paid receipt (left) and a receipt for a bill awaiting payment verification (right).

Setting up the printer

1. Install the printer driver and make it the default printer on the computer/tablet.
2. In the print dialog choose paper size **80 mm** (or "Roll 80 mm"), **scale 100%**, margins **None**, and turn off **Headers and footers**.
3. Open **POS -> POS Settings**: set paper width **80**, the font size (12 is a good start) and keep **Auto-print** on if you want the bill to print after every sale.
4. Finish a test sale and print.
5. For one-touch printing without the dialog on a shop computer, start Chrome/Edge/Brave with the option `--kiosk-printing`.

> **TIP**
> The font is a clean sans-serif (Arial) at 12 px. If your printer output looks light, raise the printer's print density in its own settings.

7.10 Holding and resuming bills

If a customer wants to keep browsing, tap **Hold** to park the bill (shortcut **F8**). The **Held** button shows a counter. Tap **Held** and press **Resume** on the right bill, or the red cross to discard it.

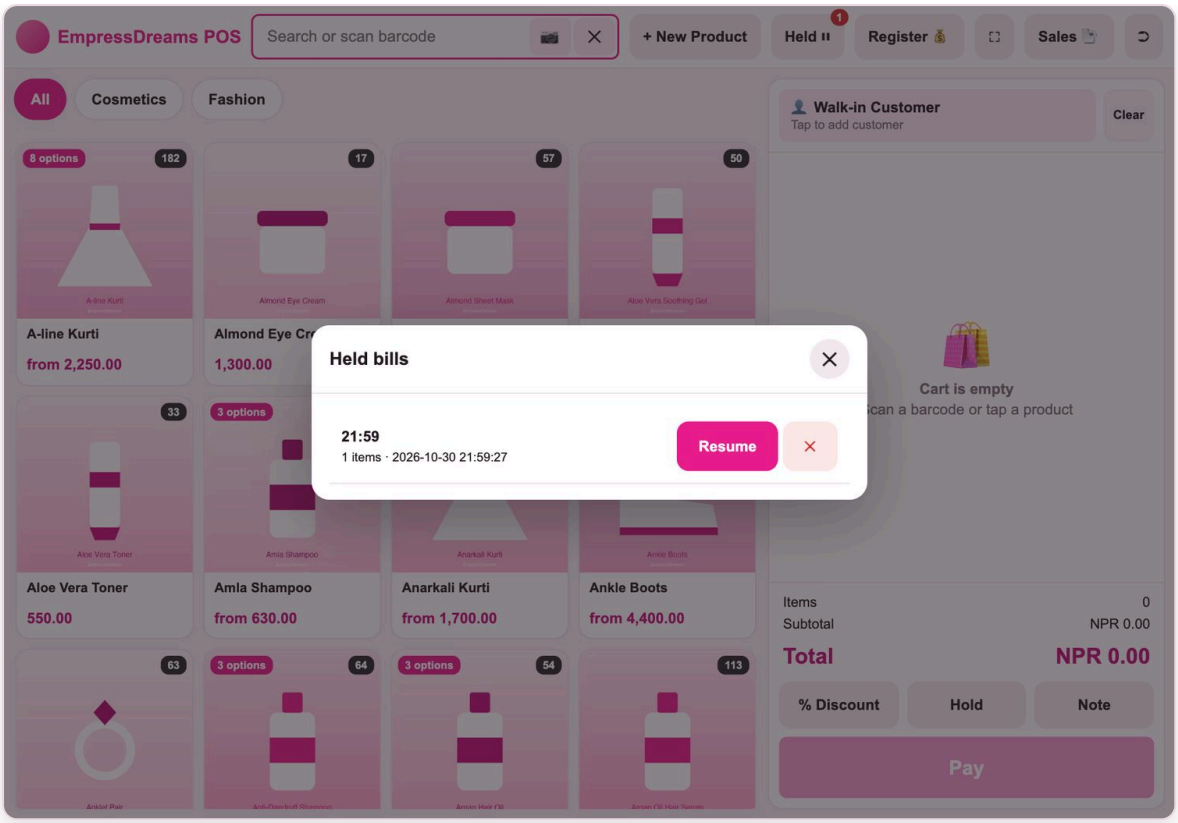

Figure 47. Held bills.

7.11 Returns and exchanges

1. Open **POS -> Sales & Returns** and press **Return** on the bill.
2. Enter the quantity returned for each line, choose the refund method (cash, card, wallet or store credit) and a reason.
3. Press **Process return & print**. A credit note prints, items go back into stock, and the bill is marked refunded when everything has been returned.

The refund amount is the discounted, tax-inclusive value the customer actually paid for those items.

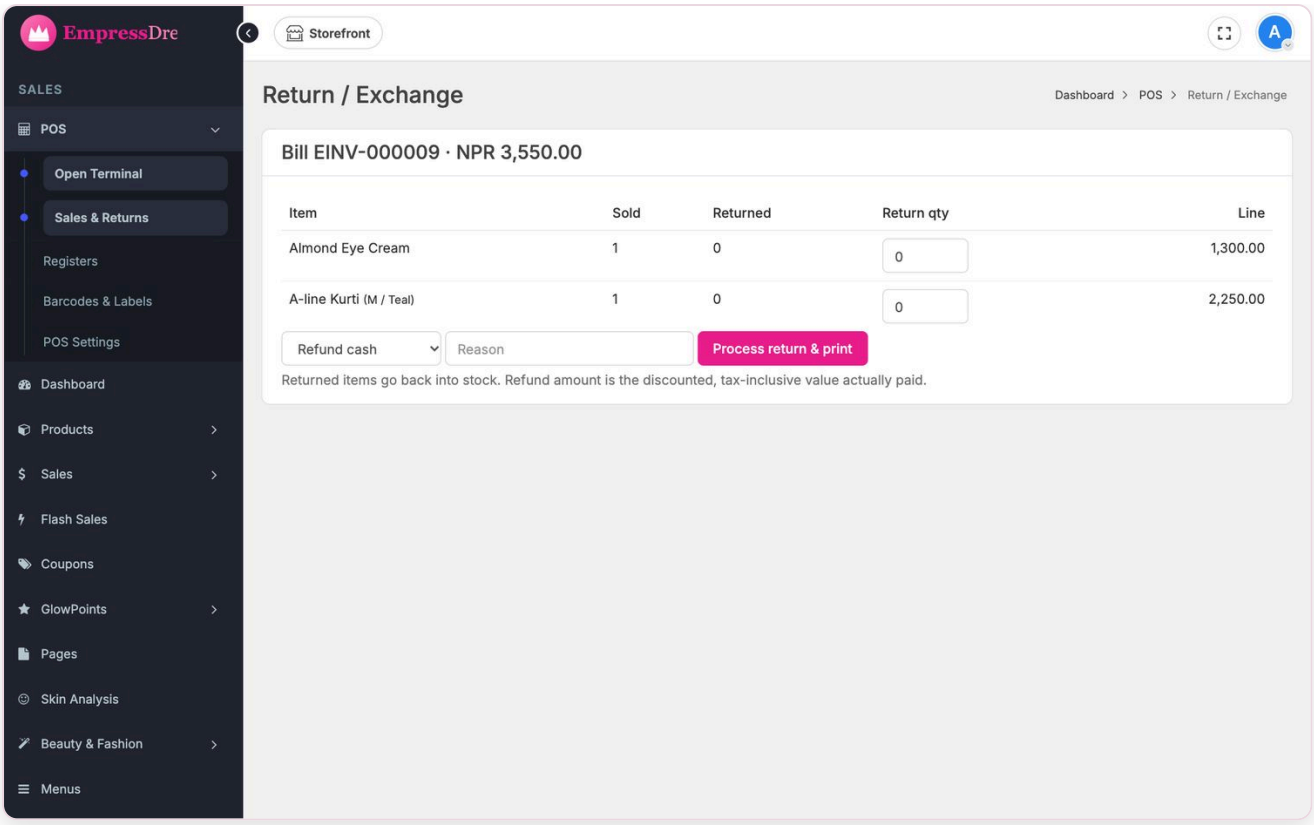

Figure 48. Return form.

7.12 Adding a product while selling

Tap **+ New Product**, scan its barcode (or leave it empty to auto-generate one), type the name, price, stock and category, then **Save product**. For size or colour variants use Admin -> Products instead.

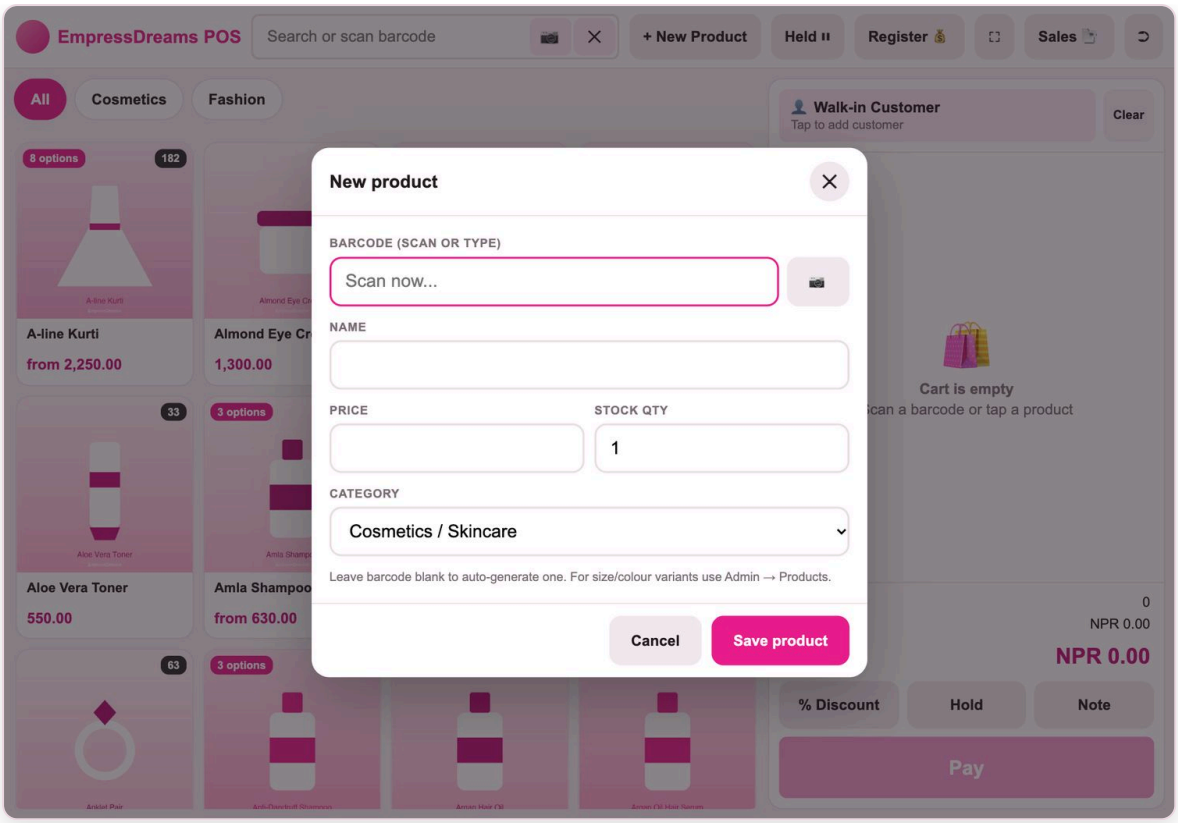

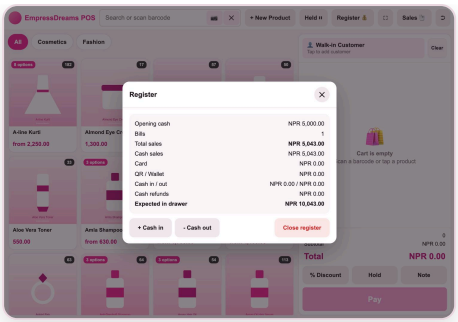

Figure 49. The New product dialog with a barcode field ready for scanning.

7.13 Cash in/out, closing the register and the Z-report

- **Register** shows opening cash, number of bills, sales by payment method, cash in/out and the **cash that should be in the drawer**.
- **+ Cash in / - Cash out** records money added or removed (for example paying a delivery boy) with a reason.
- **Close register**: count the drawer, type the amount, and the system stores the **variance**. A printable **Z-report** opens.

Total sales	**8,593.00**
Cash	5,043.00
Card	0.00
Qr	0.00
Bank	3,550.00
Other	0.00
Opening cash	5,000.00
Cash in	0.00
Cash out	0.00
Cash refunds	0.00
Expected cash	**10,043.00**

Signature: _____

Figure 50. Register summary and the printable Z-report (end-of-day report).

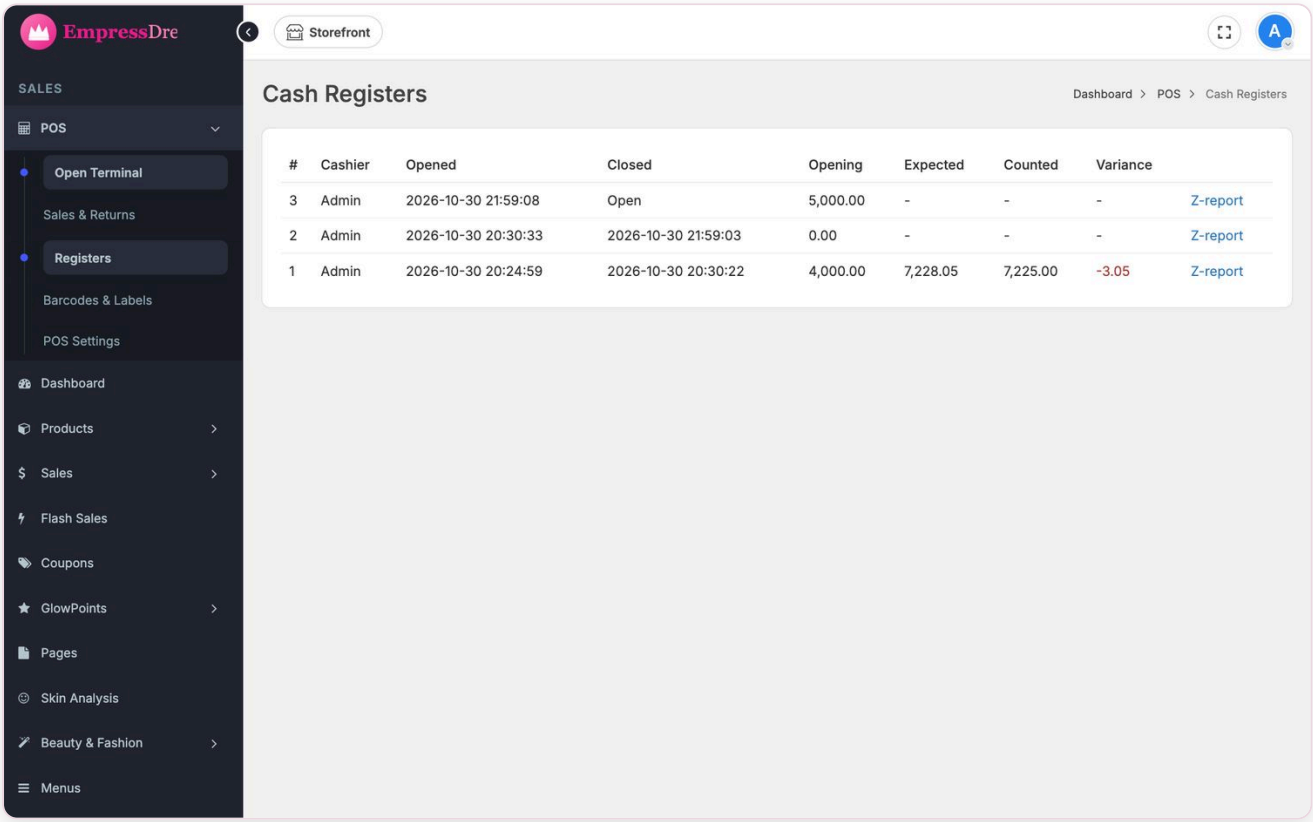

Figure 51. Registers list: expected vs counted cash and variance. Open the Z-report for any past register.

7.14 Using POS on a phone

On phones the layout changes automatically: the product grid fills the screen, a dark bar at the bottom shows the item count and total, **View cart** slides the cart up, and **Pay** opens full-screen payment. You can also install it like an app: open the POS in Chrome/Safari and choose **Add to Home Screen**.

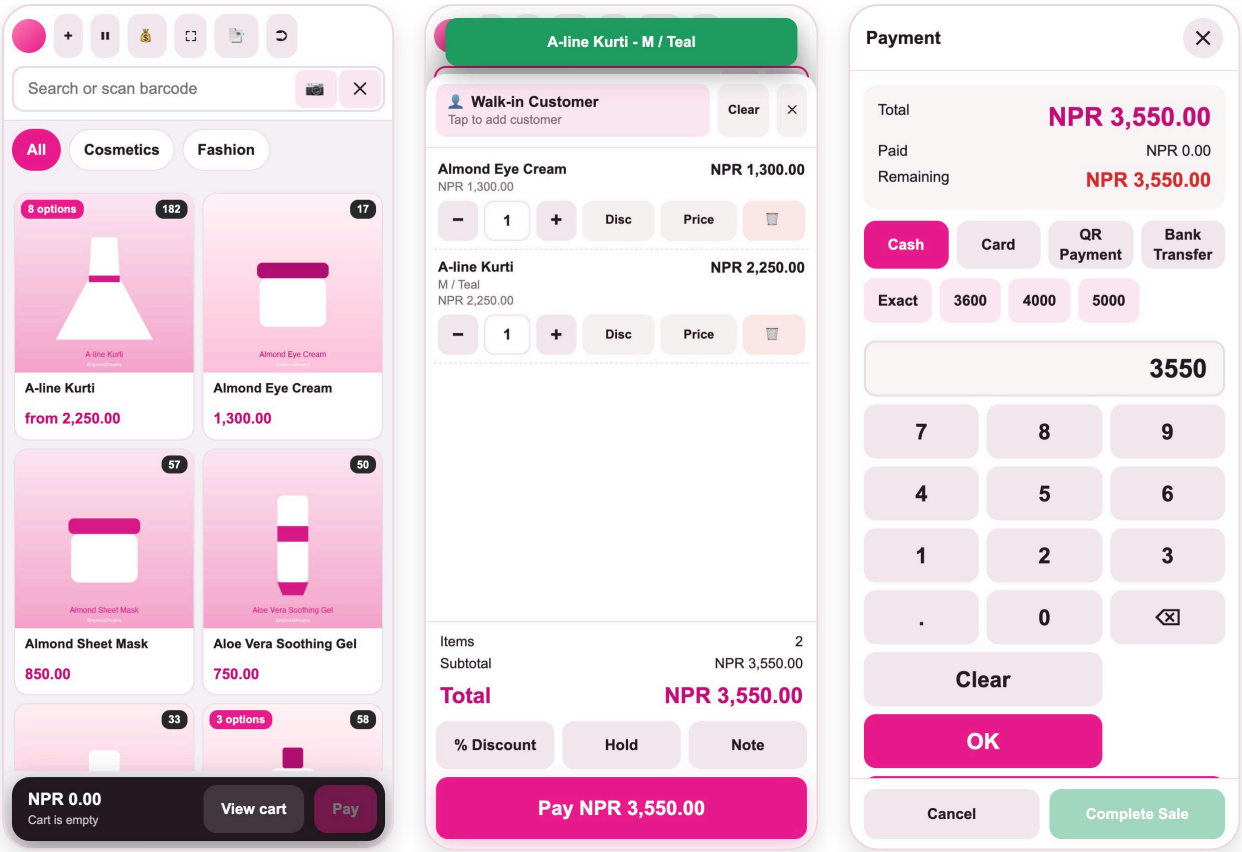

Figure 52. POS on a phone: product grid with the cart bar, the cart drawer, and the payment screen.

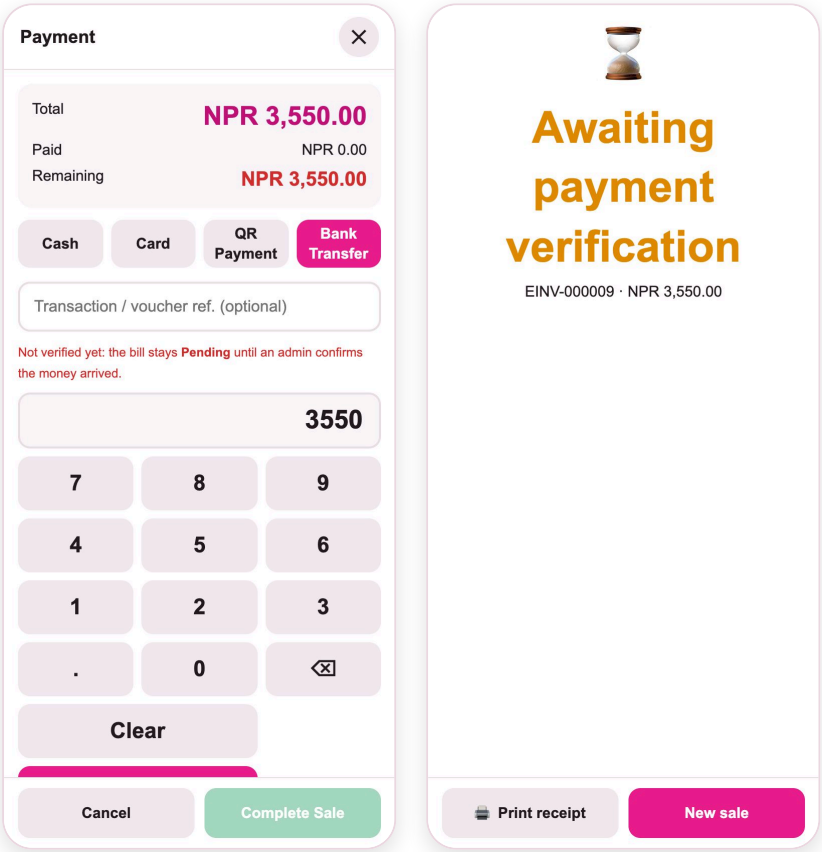

Figure 53. Bank transfer payment on a phone and the "Awaiting payment verification" result.

7.15 Keyboard shortcuts

Key	Action
F2	Focus the search / scan box
F4	Open the payment dialog
F8	Hold the current bill
Esc	Close a dialog

7.16 POS settings

Open **POS -> POS Settings**. Changes apply immediately.

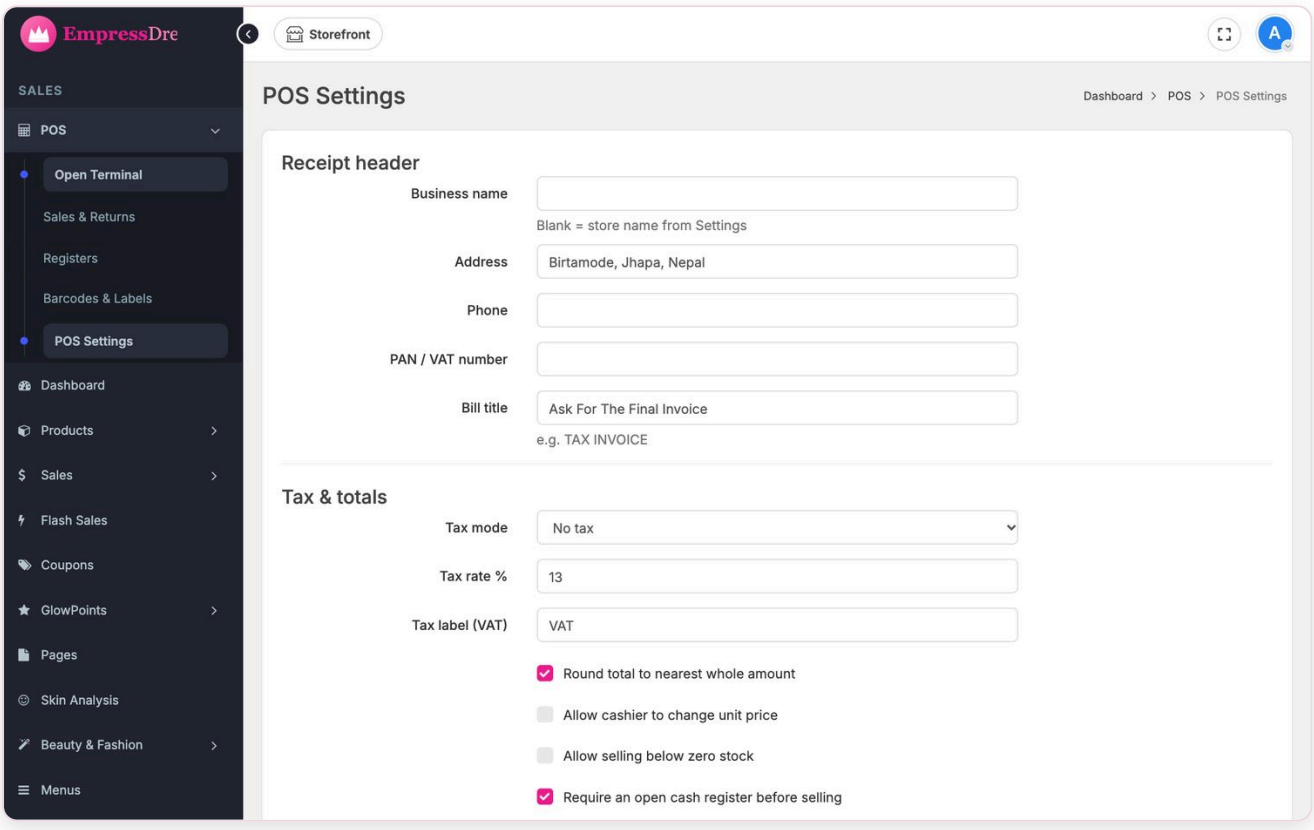

Figure 54. POS Settings: receipt header, tax, totals and printing options.

Setting	Meaning
Business name, address, phone, PAN/VAT number	Printed at the top of every receipt.
Bill title	For example TAX INVOICE.
Tax mode / rate / label	**Prices include tax**, **Add tax on top** or **No tax**. Nepal VAT is 13%.

Setting	Meaning
Round total	Round the bill to the nearest whole rupee (the rounding is printed).
Allow cashier to change unit price	Shows the **Price** button in the cart.
Allow selling below zero stock	Lets you sell items the system thinks are out of stock.
Require an open cash register	Blocks sales until a register is open.
Low-stock warning	Stock badges turn orange at or below this number.
Invoice prefix	The letters before the bill number, for example INV-.
Paper width / font size / auto-print	80 or 58 mm, text size and printing after each sale.
Logo, barcode, "You saved", return policy, footer	What is printed at the bottom of the receipt.

7.17 Troubleshooting the POS

Problem	Fix
"Open the cash register first"	Press **Register** and open it with the opening cash.
Scanner types into the wrong place	Click the page background (not an input box) and scan again, or press **F2** and scan.
Unknown barcode	The product has no barcode yet - assign it under Barcodes & Labels, or use **+ New Product**.
"Not enough stock"	Update the stock in the product (or enable overselling in POS Settings).
Camera scan does nothing	Allow camera permission in the browser. Camera works only on **https** sites.
Receipt prints on the wrong paper size	Set the printer paper to 80 mm, margins None, scale 100%.
Prices look wrong after a product change	Press the browser's refresh button - the POS reloads the catalogue (it also refreshes every 2 minutes when idle).

CHAPTER 8

Barcodes and labels

Every product and every variant has a unique barcode (EAN-13 style, prefix 200). Barcodes are used by the POS scanner and printed on labels.

8.1 How barcodes are created

- Any new product or variant gets a barcode **automatically**.
- Imported or older products can be given barcodes in bulk: **POS -> Barcodes & Labels -> Generate all missing barcodes**.
- You can also use manufacturer barcodes (EAN/UPC): scan or type them over the generated ones.

8.2 Barcodes & Labels page

1. Open **POS -> Barcodes & Labels**.
2. Search by name, SKU or scan a barcode into the search box to find a product.
3. Click into a barcode box and **scan** (or type) a code, then press **Enter** - it saves immediately and moves to the next box. The gear button generates a new code.
4. Tick products and press **Print labels for selected**.

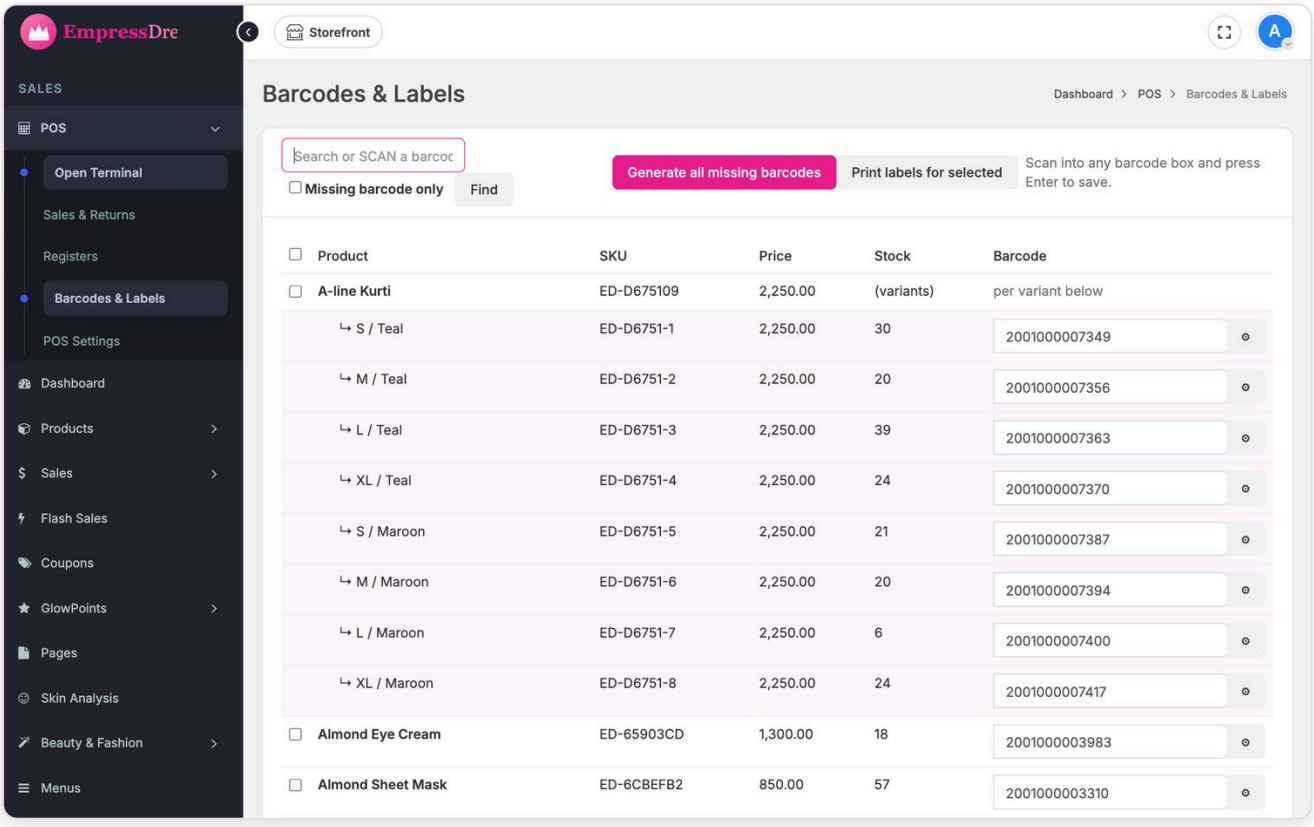

Figure 55. Barcodes & Labels: variants are listed under their product, each with its own barcode.

On any product's edit page the **Barcode (POS)** box does the same for that single product.

8.3 Printing labels

The label sheet prints one label per variant (and per copy). The default size is 50 x 30 mm; add `&w=40&h=25` to the address to change it. Labels show the product name, variant, price and a scannable Code 128 barcode with the number under it.

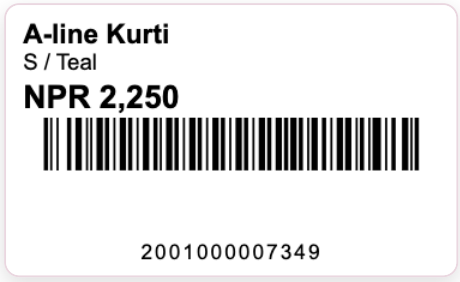

Figure 56. A shelf/garment label for a kurti variant.

> **TIP**
> Print labels on a thermal label printer (50 x 30 mm roll) and stick them on the product or tag. Scan a label to check it works before printing a whole batch.

8.4 Scanners

Type	Notes
USB / Bluetooth scanner	Works like a keyboard. No installation. Set it to add an **Enter** after each scan (most do by default).
Camera	Press the camera button in the POS. Works on Chrome/Edge (Android, desktop) over https.
Phone as scanner	Open the POS on the phone and use the camera button.

CHAPTER 9

GlowPoints loyalty programme

GlowPoints reward customers for buying. You can rename the points in settings; everything below uses the name GlowPoints.

9.1 How customers earn and spend

Event	Default
Welcome bonus when a customer registers	100 points
Points earned	**1 point for every NPR 100** spent (after discounts, excluding shipping and tax)
When points are awarded	When the order becomes **Completed**
Value of 1 point	NPR 1
Minimum to redeem	100 points
Maximum payable with points	50% of the bill
Points expire	365 days after they are earned

Example: a customer buys NPR 3,000 of products and uses a 10% coupon (NPR 300). The base is NPR 2,700, so the customer earns 27 points when the order is completed. Next time, 100 points reduce the bill by NPR 100.

9.2 Customers: checking and using points

1. My Account -> **GlowPoints** shows the balance, its value in rupees and every earn/spend entry with expiry dates.
2. At checkout (logged in) a **GlowPoints** box under the coupon field shows the balance. Type how many points to use and press **Redeem**. The discount appears in the order summary.
3. In the POS, select the customer and accept the offer to use points.

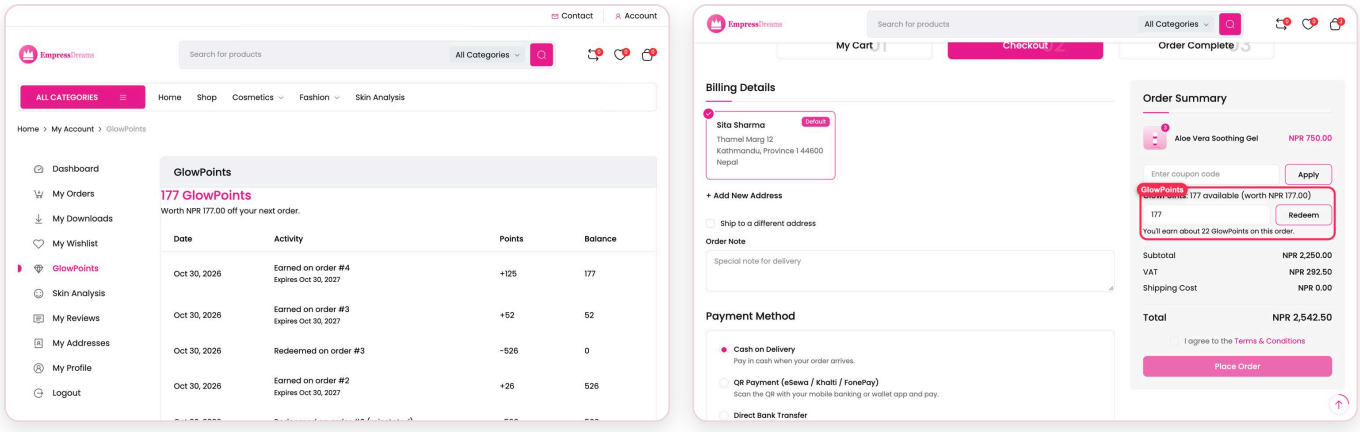

Figure 57. The GlowPoints page in My Account and the redeem box at checkout (1).

9.3 What happens when orders change

- **Canceled or Refunded:** points the customer used are returned and points they earned are taken back.
- **Reinstated** (changed from Canceled back to another status): the used points are deducted again.
- **Failed/abandoned payment:** points used on an order that is removed are returned automatically.
- **QR/bank POS sales:** points are only earned after you press **Verify payment**.

9.4 Admin: settings and ledger

Open **GlowPoints -> Settings** to change every number above. Open **GlowPoints -> Transactions** for the full ledger and to adjust a customer's balance by email (positive to add, negative to remove).

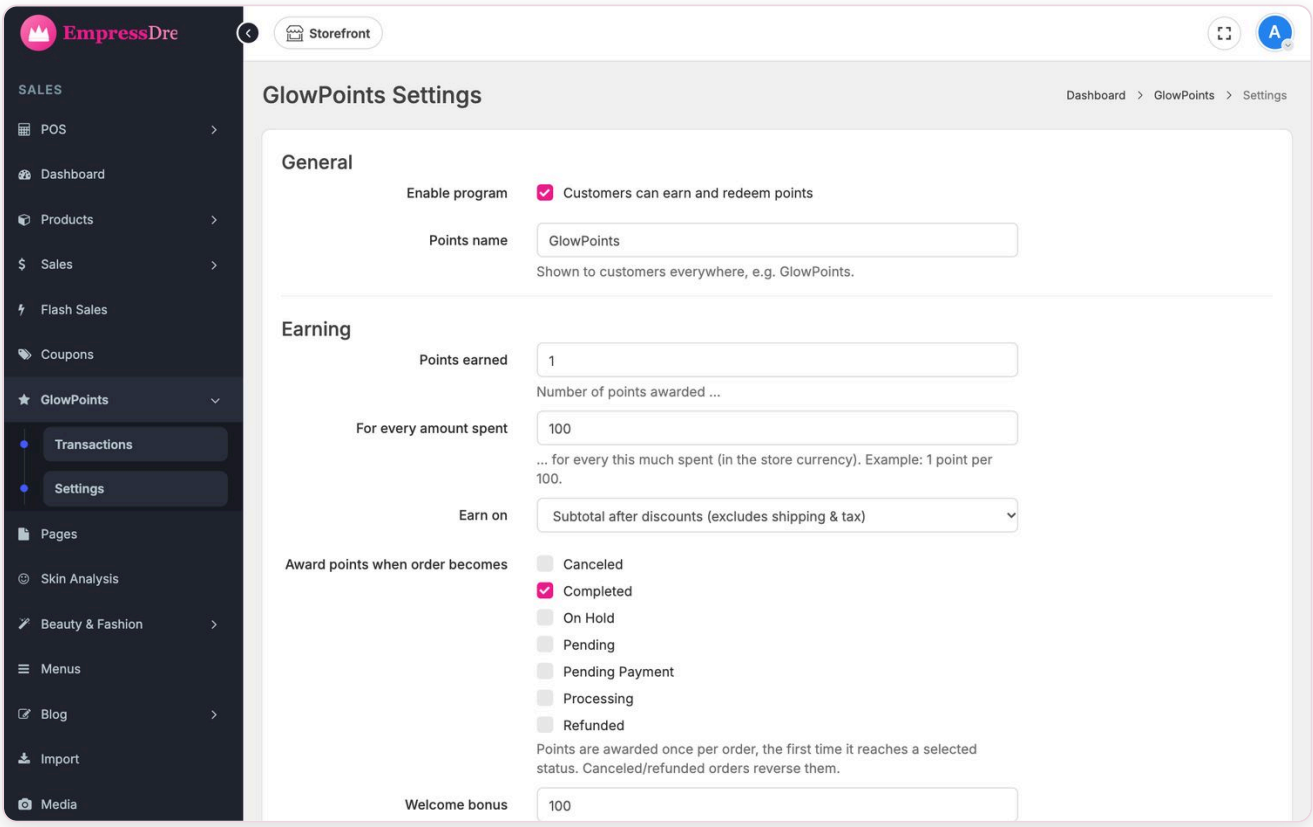

Figure 58. GlowPoints settings: name, earn rate, statuses that award points, bonuses, expiry and redemption rules.

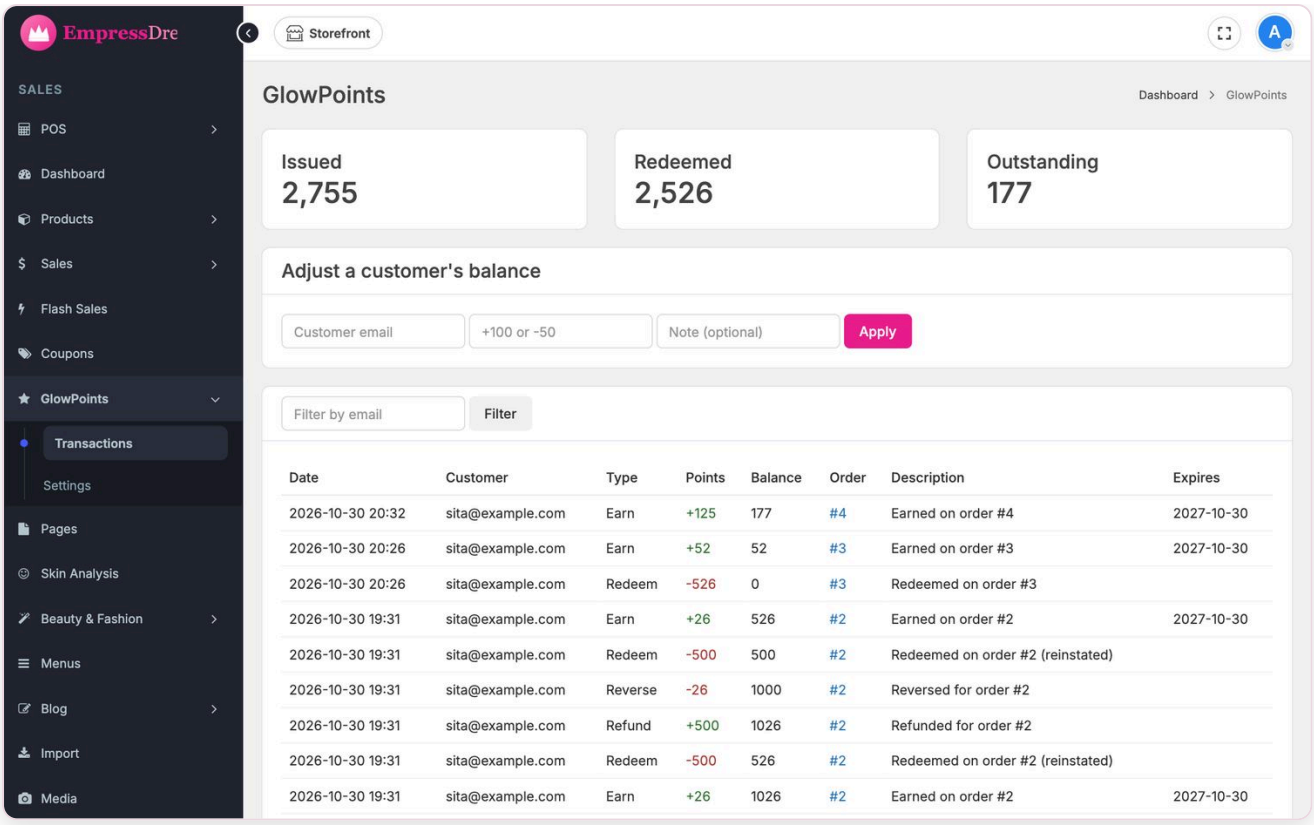

Figure 59. Transactions page with totals, the manual adjustment form and the ledger.

TIP

Run promotions by temporarily raising
POINTS EARNED
(for example 2 points per NPR 100) or using the manual adjustment to thank a customer.

CHAPTER 10

Skin Analysis

Customers can take a selfie and receive a skin report, tips and product suggestions from your in-stock catalogue.

10.1 For customers: how to use it

Open https://empressdreams.com/skin-analysis (it is also in the top menu and under My Account).

1. Remove makeup, tie hair back and stand in front of a window or in soft daylight.
2. Press **Start camera** (allow camera access) or **Upload a photo** of a clear, front-facing face.
3. Fit your face inside the oval. The label above the camera says what to adjust ("Move closer", "Too dark", "Perfect - hold still"). The oval turns green when ready.
4. Press **Capture**. Analysis takes a few seconds.
5. Read your report: score, skin type, tone and shade, a bar for each concern, tips, a morning and evening routine, and recommended products.

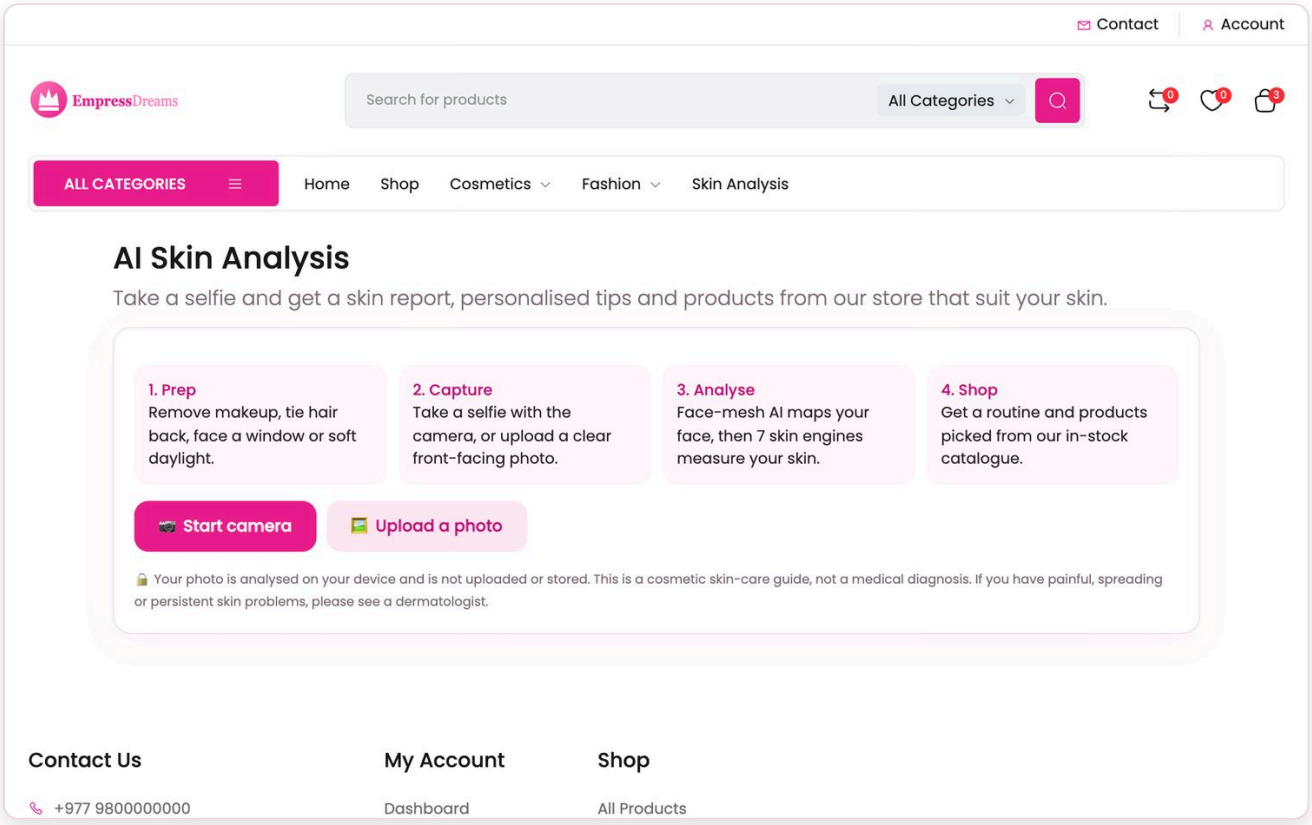

Figure 60. The Skin Analysis start page.

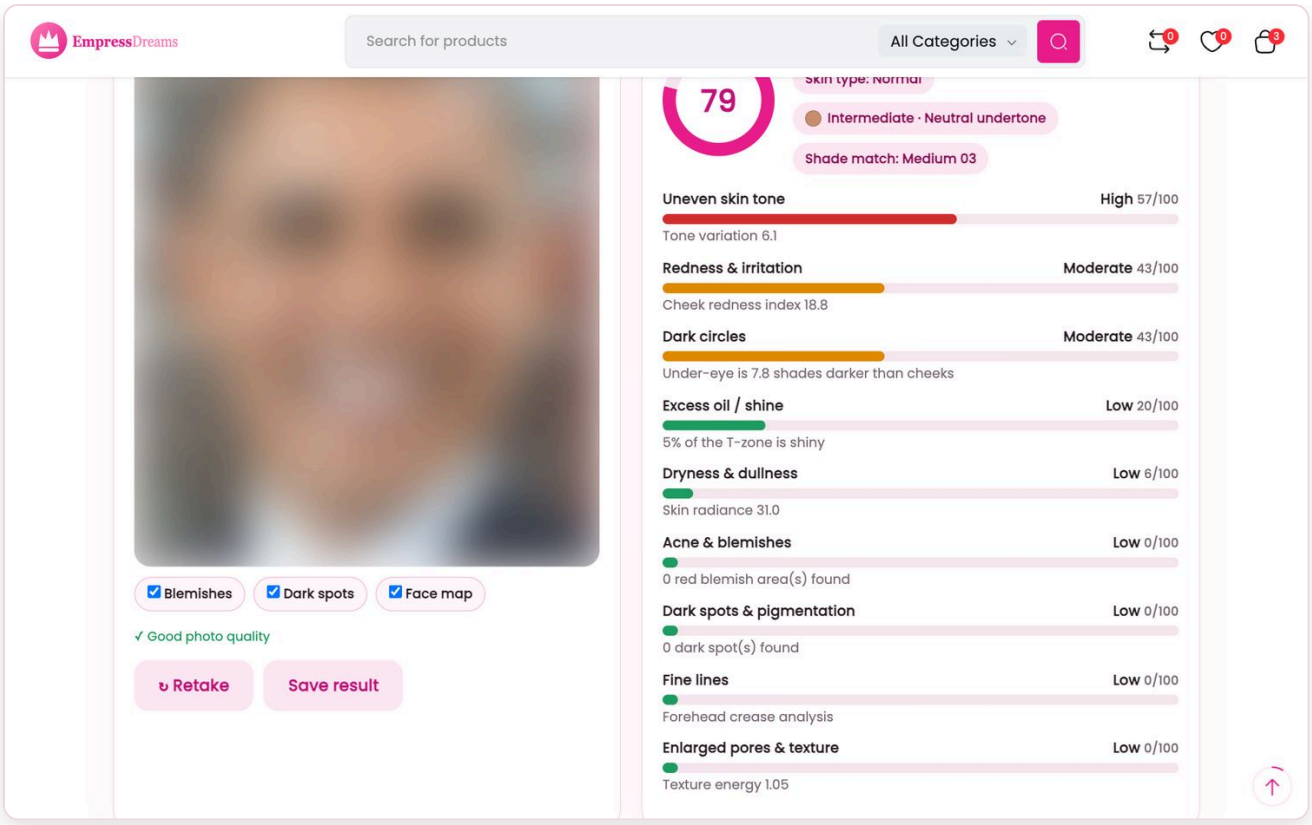

Figure 61. The result: skin health score, skin type, tone and undertone with shade match, and a bar for each concern. (The photo is blurred in this manual to protect privacy.)

10.2 What the report shows

Item	Meaning
Skin health score	0-100 overall score (higher is better), combining all measurements.
Skin type	Oily, Dry, Combination or Normal, estimated from shine in the forehead/nose/chin compared with the cheeks.
Tone, undertone, shade match	Measured skin colour; the shade (for example Medium 03) is matched to foundation shades in the store.
Concerns	Acne & blemishes, redness, dark spots, uneven tone, dark circles, fine lines, enlarged pores/texture, excess oil, dryness/dullness. Each has Low / Moderate / High and a score out of 100.
Rings on the photo	Red rings mark blemish areas, amber rings mark dark spots. Use the checkboxes to show or hide layers.

10.3 Tips, routine and products

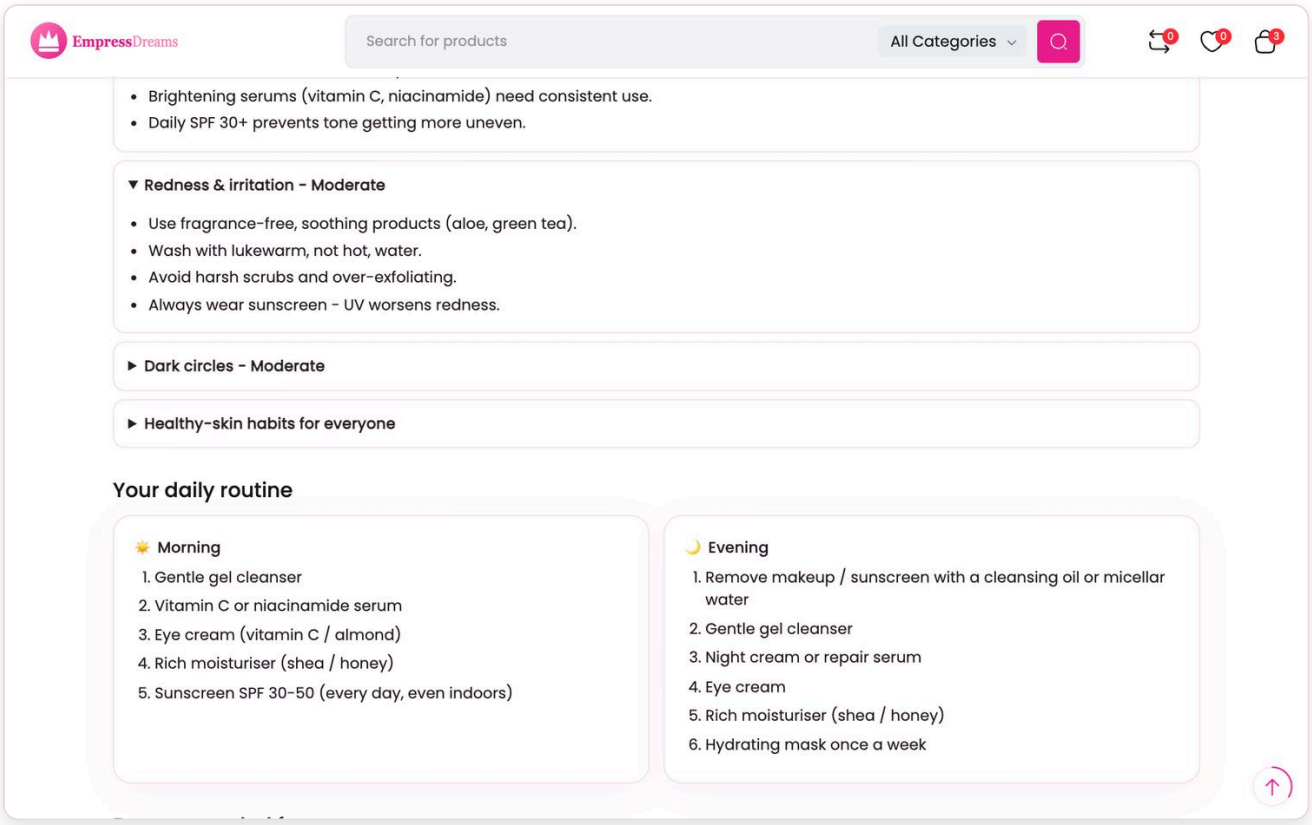

Figure 62. Personalised tips for the top concerns and a morning/evening routine.

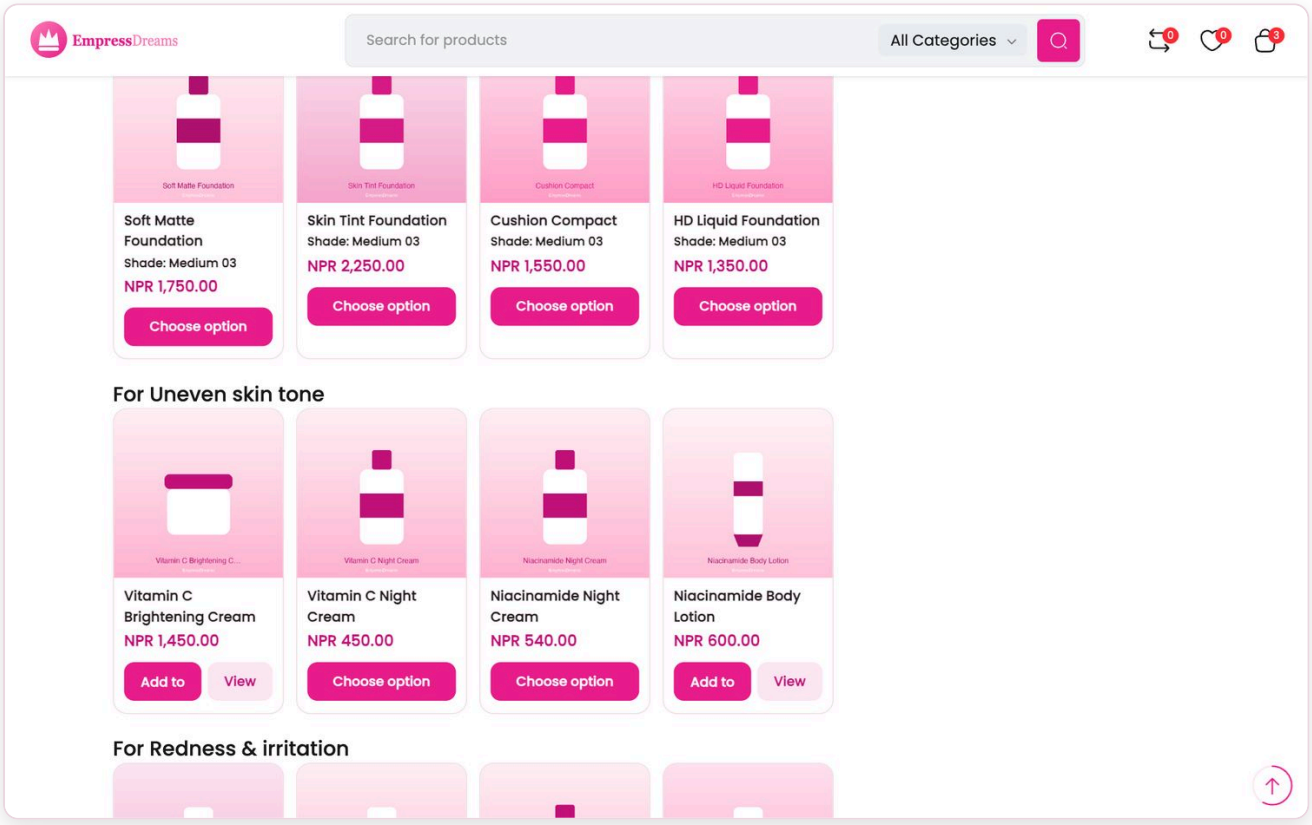

Figure 63. Products from the store: foundation in the matching shade, products for each concern and daily sun protection.

Suggestions are chosen from the store's own **in-stock** products by matching ingredient words in product names and descriptions (for example Vitamin C, Niacinamide, Tea Tree, Hyaluronic, Retinol). **Add to cart** works directly for simple products; products with options open their page.

> **TIP**
> To improve recommendations, use clear ingredient and product-type words in your product names and descriptions.

10.4 Saving results

Logged-in customers can press **Save result**. Only the scores are saved (never the photo). They appear under My Account -> Skin Analysis so customers can track progress.

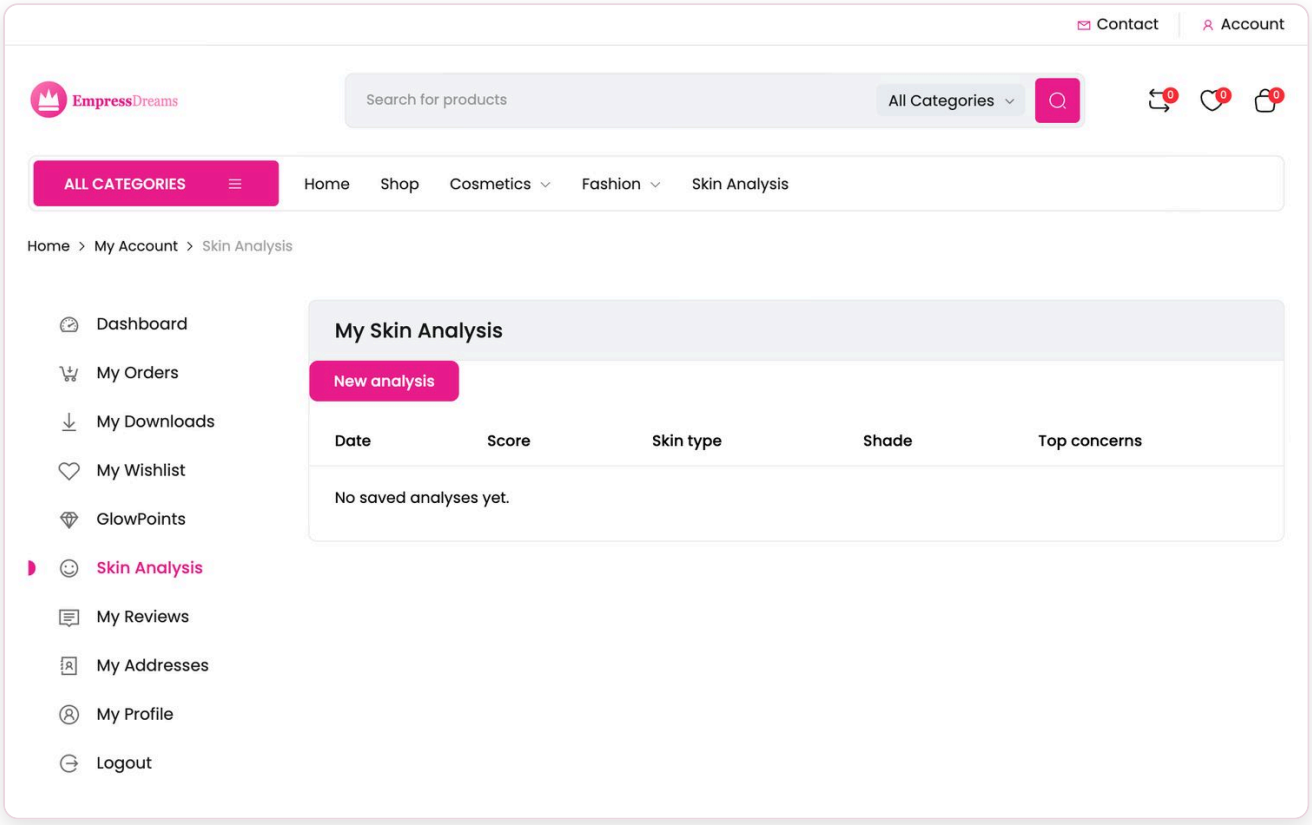

Figure 64. Saved skin analyses in My Account.

10.5 How it works

The analysis runs entirely **inside the customer's browser**. The photo is not uploaded or stored.

Engine	What it does
Face Landmarker model (Google MediaPipe)	A trained face-mesh model finds the face and 478 points so the forehead, cheeks, nose, chin and under-eye areas can be located.
Colour engine	Measures skin colour in CIELAB, works out tone and undertone, redness and radiance.
Blemish detector	Finds small red spots that stand out from the surrounding skin.

Engine	What it does
Pigmentation detector	Finds small dark, non-red spots and overall tone unevenness.
Texture engine	Measures fine surface detail (pores and roughness) and horizontal forehead lines.
Shine engine	Measures bright reflections in the T-zone versus cheeks to estimate oiliness and skin type.
Under-eye engine	Compares under-eye brightness and colour with the cheeks for dark circles.

IMPORTANT
Only the face-mesh model is a trained machine-learning model; the other engines are image-processing measurements. The report is
COSMETIC GUIDANCE, NOT A MEDICAL DIAGNOSIS
. Customers with painful, spreading or persistent skin problems should see a dermatologist. The disclaimer is shown on the page.

10.6 Getting accurate results

- Use bright, even, natural light on the whole face; avoid direct sun and harsh shadows.
- Remove makeup, glasses and hair from the face; look straight at the camera.
- Hold the phone still at arm's length so the face fills most of the oval.
- Take the photo again if the report says the image is dark, blurry or unevenly lit.
- The camera needs **https** (your site has it) and the customer's permission; otherwise upload a photo.

10.7 Admin settings

Open **Skin Analysis** in the admin menu.

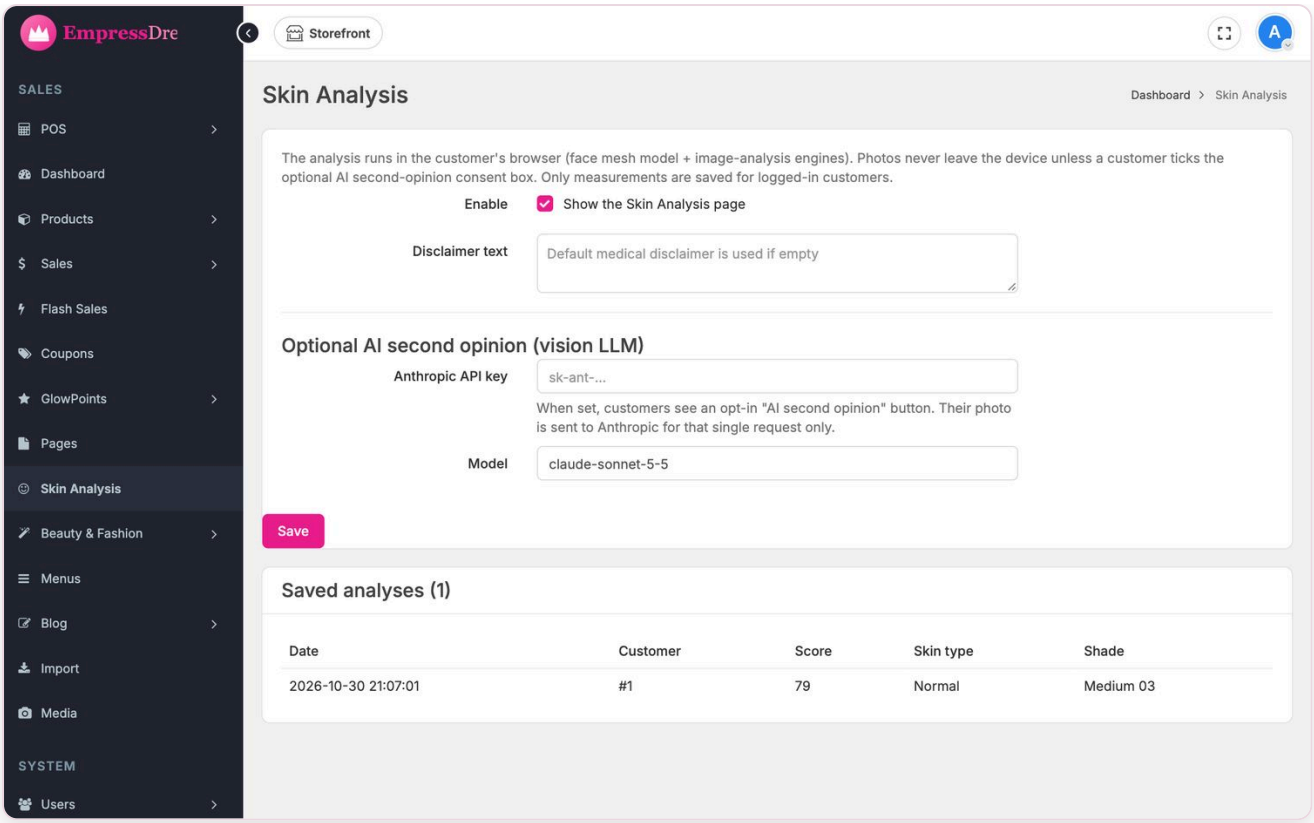

Figure 65. Skin Analysis settings and a list of saved analyses.

- **Enable** shows or hides the whole feature.
- **Disclaimer text** replaces the default disclaimer on the page.
- **Optional AI second opinion:** paste an Anthropic API key to show an opt-in button that asks a vision AI model to comment on the photo and the measurements. The customer must tick a consent box; the photo is sent for that one request only. Leave the key empty to keep everything on-device.
- The table lists the latest saved results (customer number, score, skin type, shade).

CHAPTER 11

Content and marketing

Pages, menus, sliders and the storefront settings control how the shop looks and what customers can find.

11.1 Pages

Create About, Contact, Privacy Policy, Terms or shipping information pages under **Pages -> Create Page**: name, body (with the editor) and SEO fields (meta title, keywords and description). Tick Status to publish. Link them from a menu.

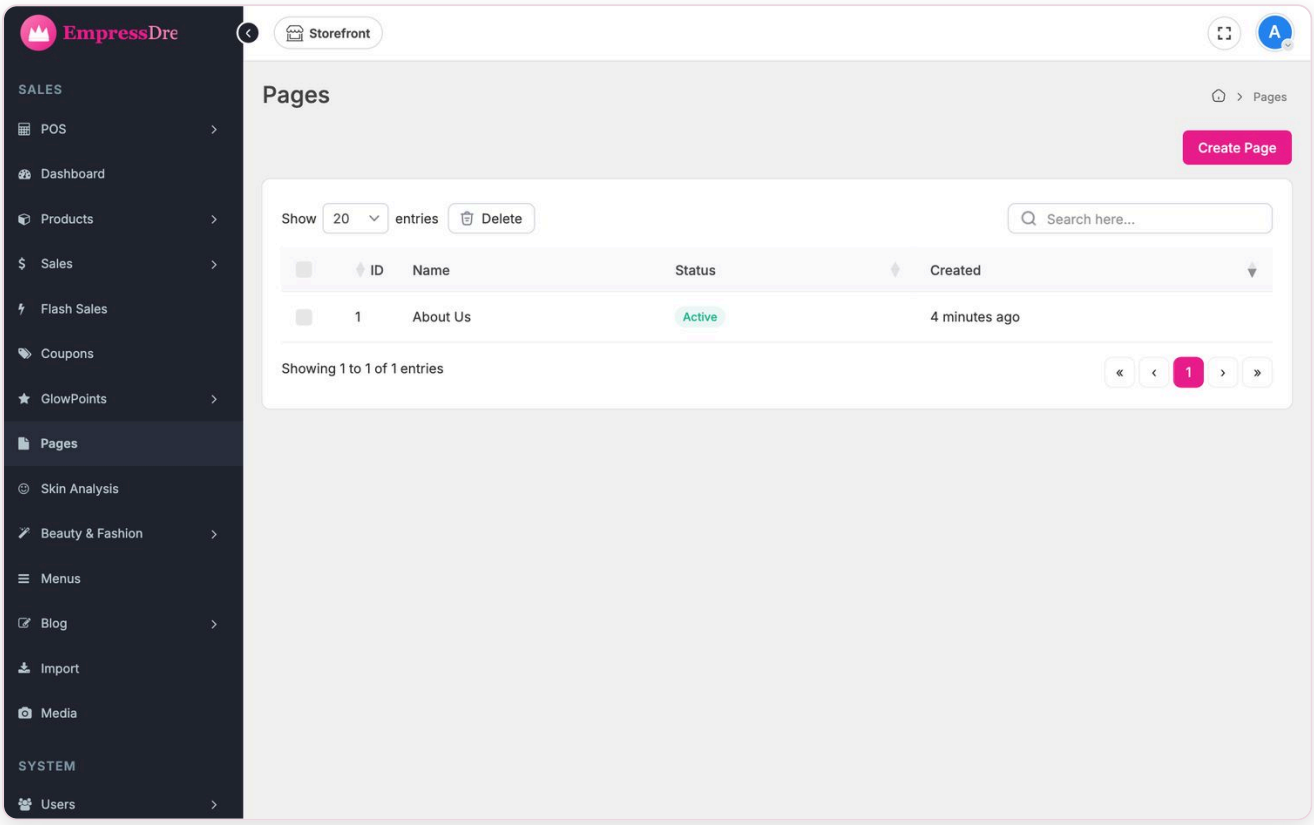

Figure 66. Pages list.

11.2 Menus

There are three menus: **Primary Menu** (top bar), **Category Menu** (the All Categories drop-down) and **Footer Menu**. Open **Menus**, choose a menu and use **Create Menu Item** to add links of type **Category**, **Page** or **URL**; drag items to reorder and nest them. After creating menus, select them under **Appearance -> Storefront -> Menus**.

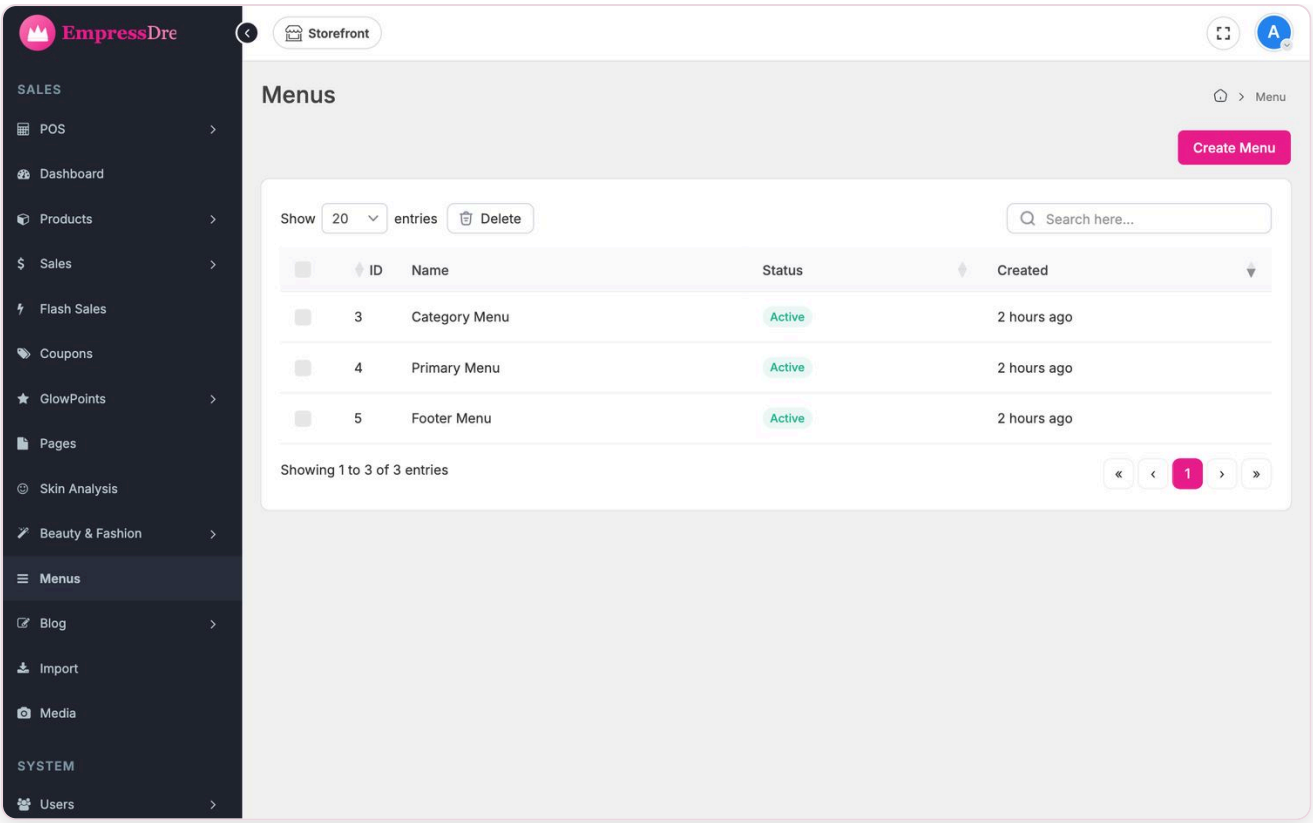

Figure 67. Menu list.

11.3 Sliders

Appearance -> Sliders -> Create Slider creates a banner slider. Add slides with an image, two caption lines, a button text and its link, set autoplay, speed and arrows, then select it under Storefront -> General -> Slider.

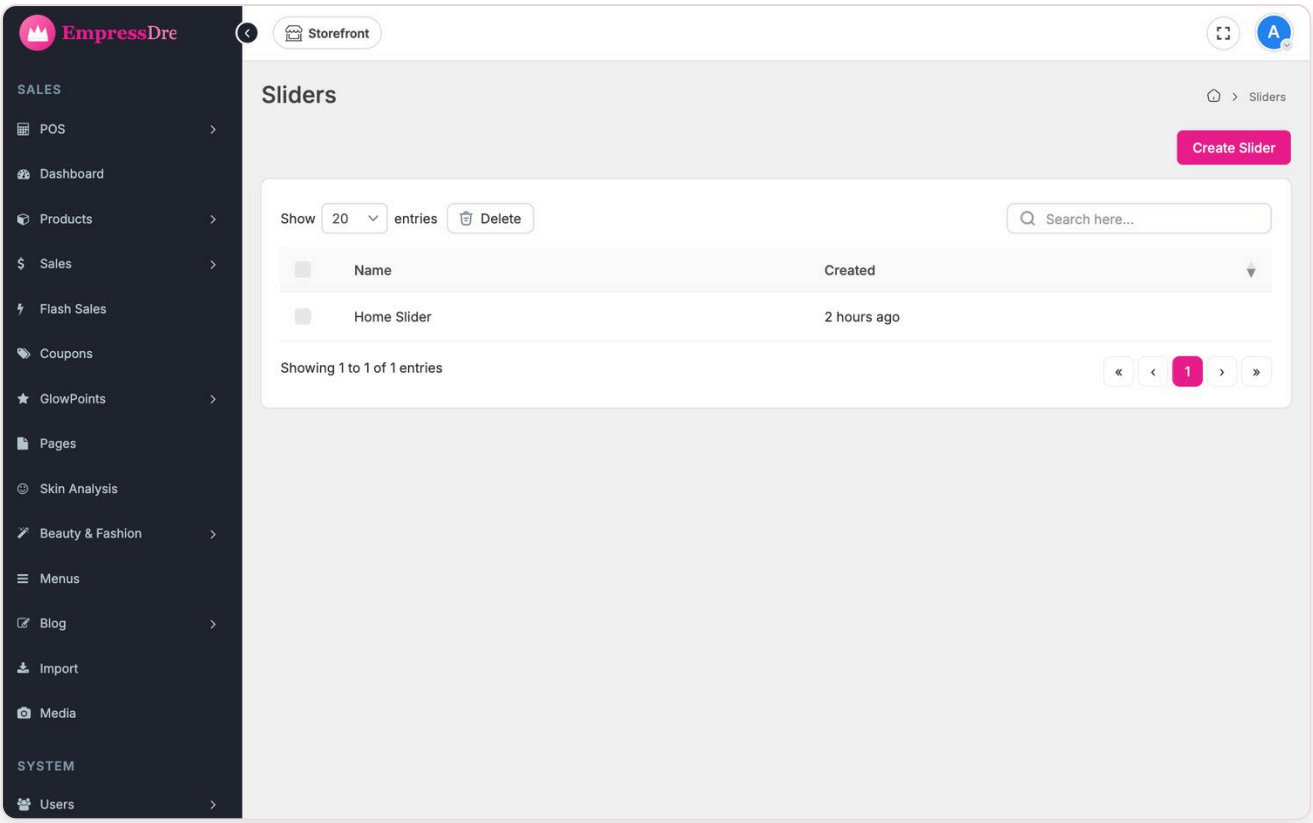

Figure 68. Slider list.

11.4 Storefront settings

Appearance -> Storefront controls the shop theme and layout.

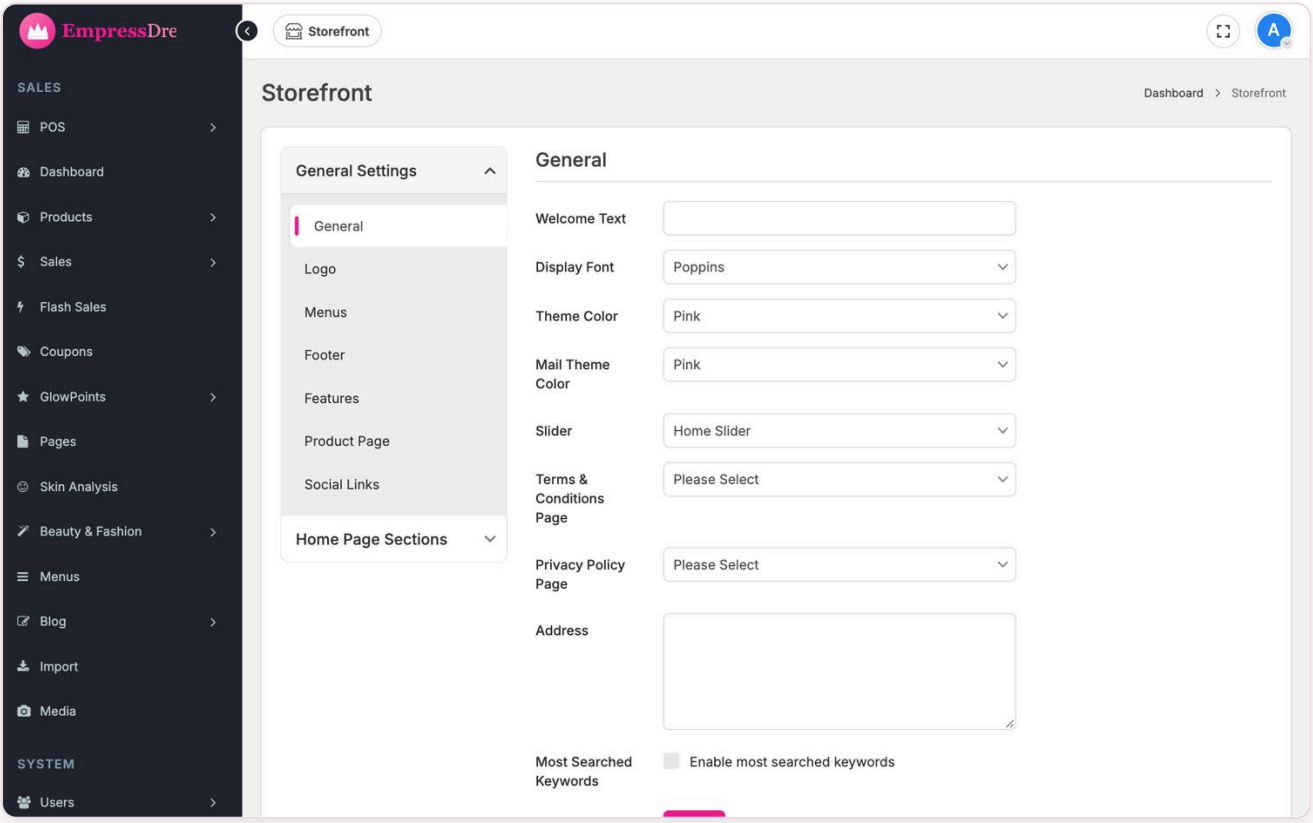

Figure 69. Storefront settings: theme colour, slider, terms/privacy pages, footer address and more.

Tab	What you set
General	Welcome text, font, **theme colour** (pink), slider, terms and privacy pages, footer address, copyright text.
Logo	Favicon, header logo and mail logo.
Menus	Primary, category and footer menus.
Footer	Footer menu titles and columns.
Features	The icon strip (free shipping, support, secure payment).
Product Page	Product page options and recommended products.
Social Links	Facebook, Instagram and other links.
Home Page Sections	Switch on and configure **Featured Categories**, **Product Tabs** (New Arrivals, Skincare and so on), **Top Brands**, **Flash Sale**, product grids and banners. Sections are turned off until you create content.

11.5 SEO

- Each product, category, page and blog post has **SEO** fields: meta title, keywords and description. Fill them in for your main products.
- The URL (slug) is generated from the name; keep it short.
- Submit the sitemap from **Sitemaps** in the admin to search engines.

CHAPTER 12

Users, roles and permissions

Give every person their own login with only the access they need.

12.1 Users

Go to **System -> Users -> Create User**. Enter name, email, phone and password, choose one or more roles, and optionally set individual permissions. Customers who register on the store are also listed here.

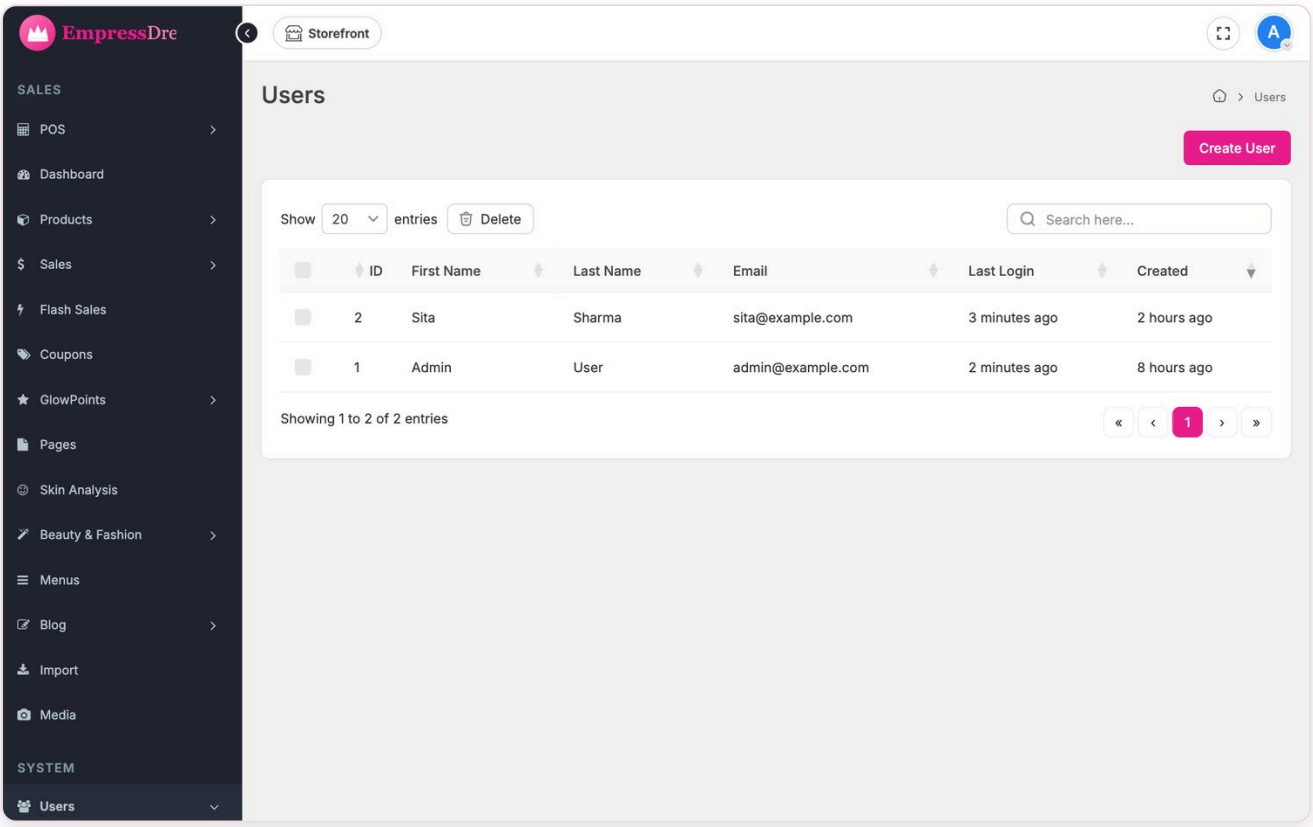

Figure 70. Users list: admin and customers.

12.2 Roles

A **role** is a group of permissions, for example Admin or Customer. Open **Roles** to create more, for example **Cashier** (POS only) or **Product manager**.

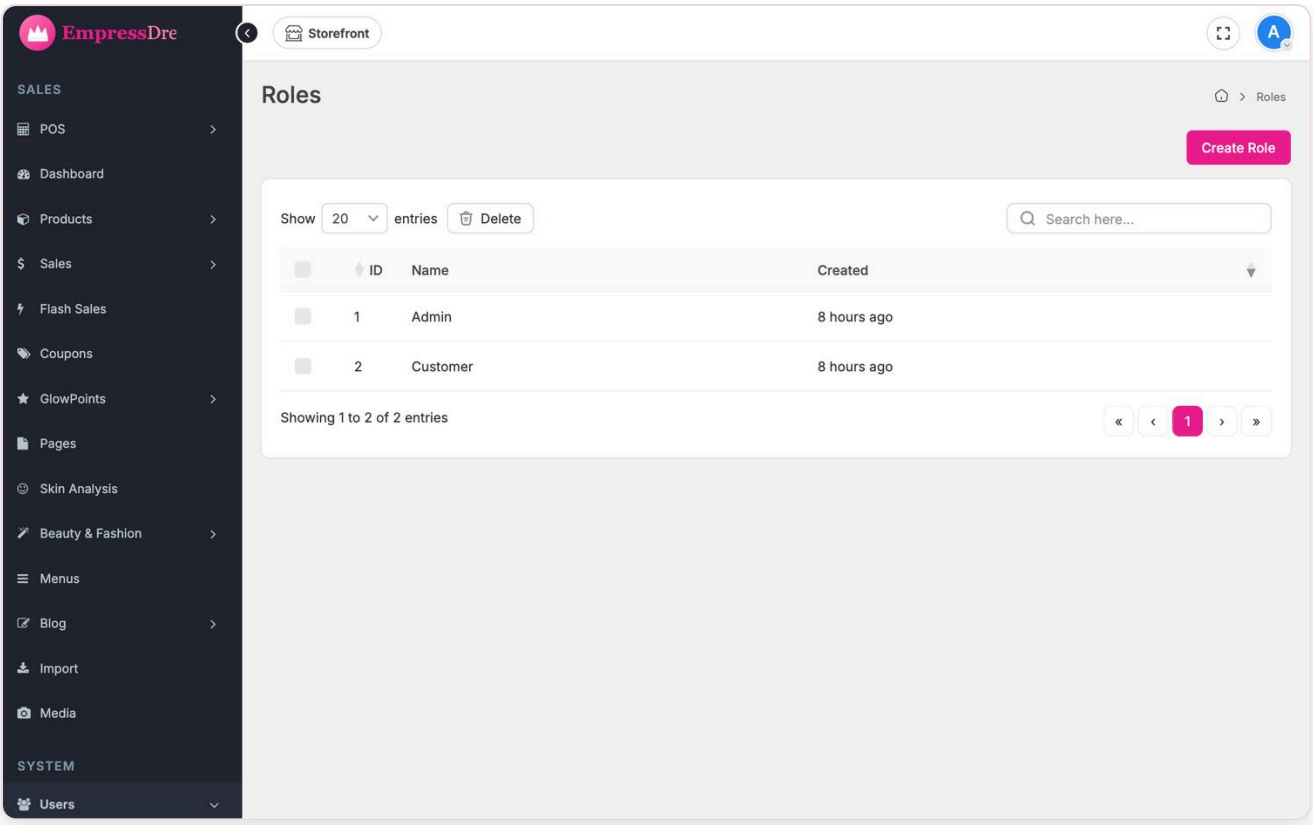

Figure 71. Roles: Admin and Customer are built in.

Permissions from roles and from the user are combined. A permission set directly on a user wins over the role, so you can give a user all of a role's permissions except one by choosing **Deny** for that permission.

> **IMPORTANT**
> The POS and some newer pages are available to any signed-in admin user. Only give admin access to people you trust. Customers can never open the admin panel.

CHAPTER 13

Settings reference

Open **Settings** in the admin menu. Each group is explained below.

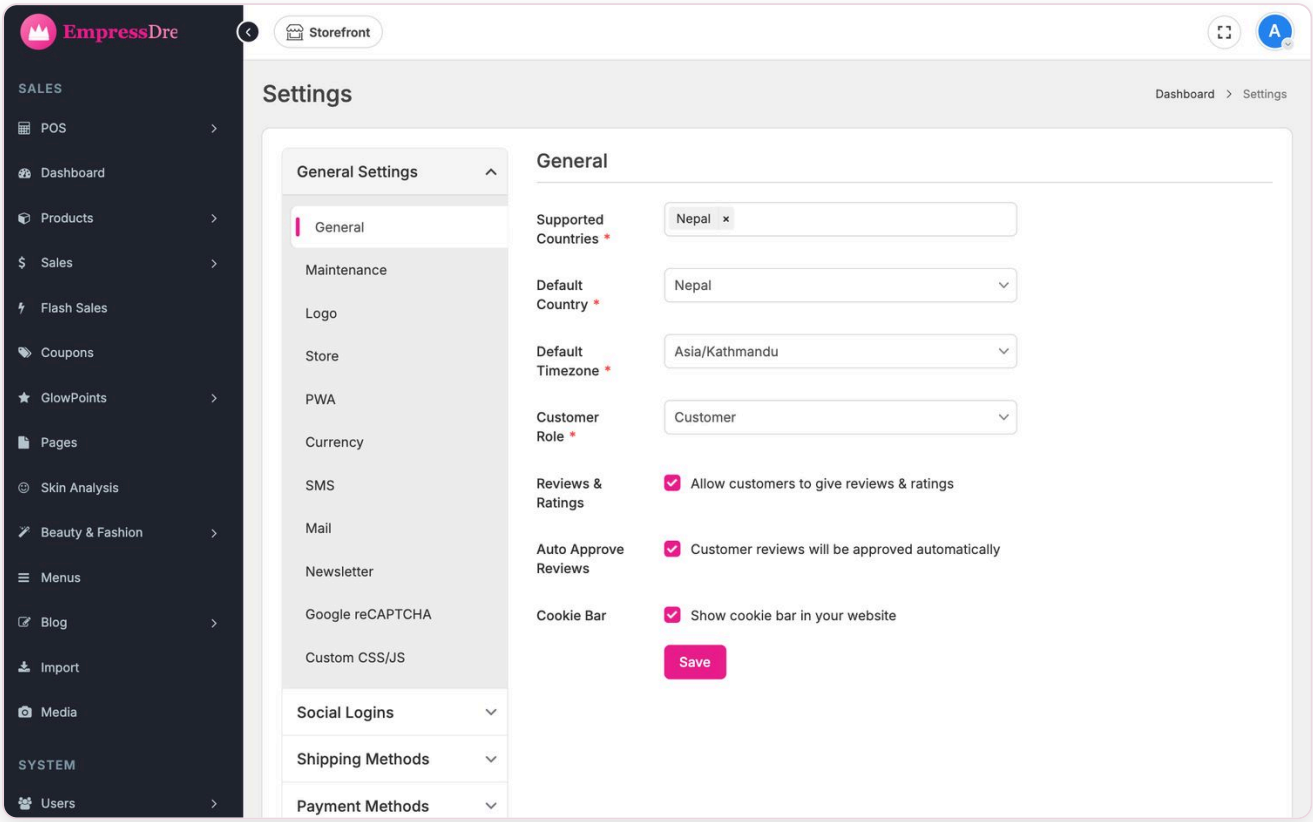

Figure 72. Settings -> General.

Tab	Key options
General	Supported countries (Nepal), default country, timezone (Asia/Kathmandu), customer role, reviews and ratings, auto-approve reviews, cookie bar.
Maintenance	Put the store in maintenance mode while you work.
Logo	Admin logos.
Store	Store name, tagline, description, email, phone and address.
PWA	Make the store installable on phones; upload the app icon.
Currency	Supported currencies (NPR) and default currency; optional exchange-rate service for multi-currency.
SMS / Mail	Sender and SMTP details so order emails and SMS are sent.
Newsletter / reCAPTCHA / Social logins	Mailchimp key, Google reCAPTCHA keys, Facebook and Google sign-in.
Custom CSS/JS	Extra code for the whole store.

Tab	Key options
Shipping Methods	Free shipping, local pickup, flat rate.
Payment Methods	Cash on Delivery, QR Payment, Bank Transfer.

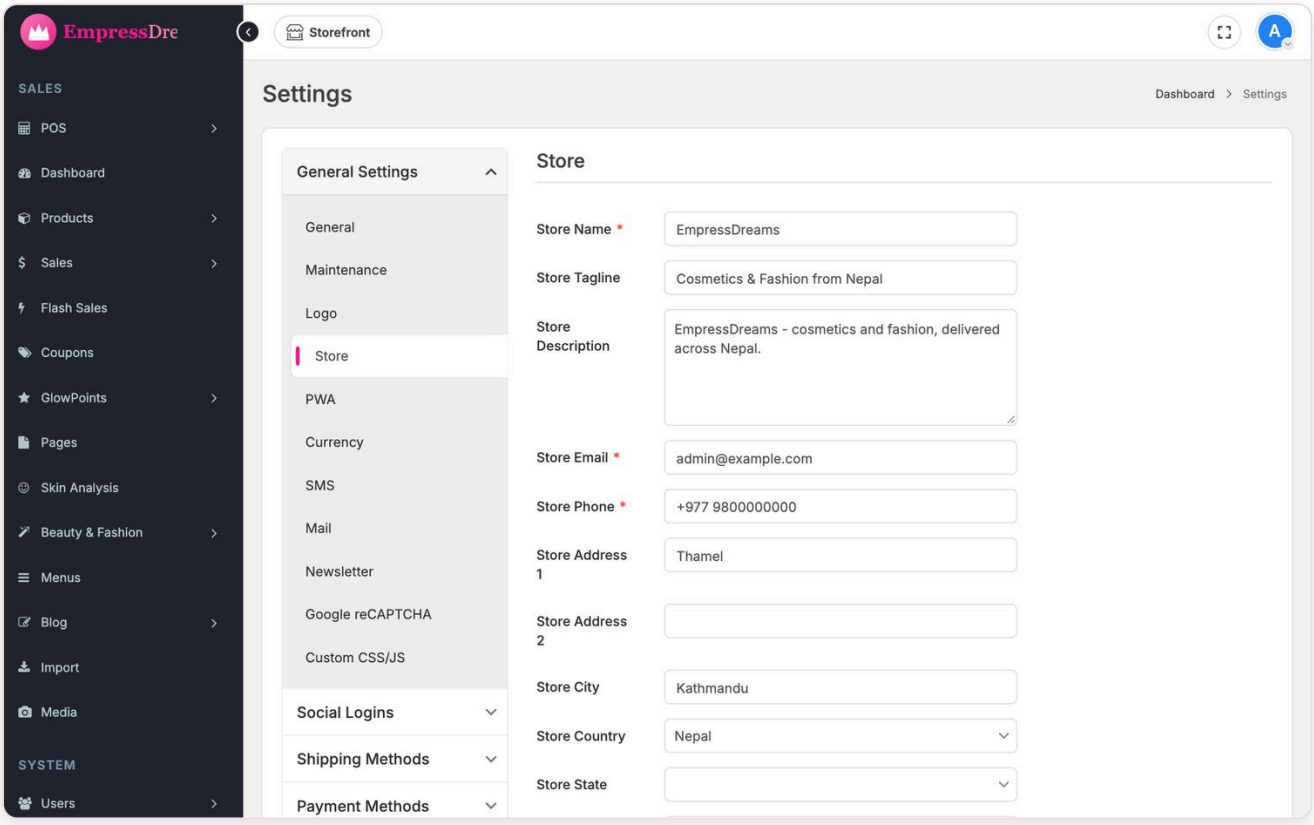

Figure 73. Settings -> Store: replace the sample phone and email with your real contact details.

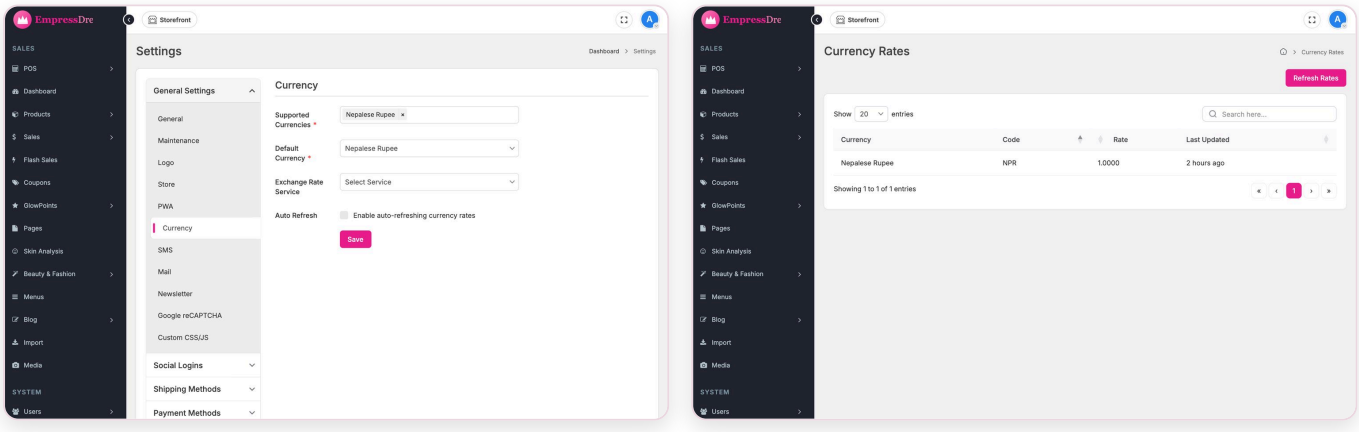

Figure 74. Currency settings and the currency rates table (NPR = 1.0000).

13.1 Languages and translations

The store runs in English. To add languages choose them under Settings -> General (supported locales), then use **Localization -> Translations** to translate store text and the language switcher at the top of the admin to translate products, categories and pages. If a translation is missing, the default language is shown.

NOTE

The Localization and Languages pages need the matching permission. Add it to your role if you do not see them.

CHAPTER 14

Server and maintenance

This chapter is for the person who looks after the server (VPS). The live store runs on your own VPS together with several other projects, so be careful with shared services.

14.1 How the live system is set up

Item	Value
Server	Ubuntu 24.04 VPS (shared with other websites)
Web server	nginx, with a site file `/etc/nginx/sites-available/empressdreams-store`
PHP	PHP 8.3-FPM
Database	MariaDB 10.11, database `empressdreams_store`, user `ed_store`
Application folder	`/var/www/empressdreams-store` (the web root is its `public` folder)
Configuration file	`/var/www/empressdreams-store/.env` (database password, URL, key)
Credentials note	`/root/empressdreams-store-credentials.txt` (admin login and database password, root only)
SSL certificate	Let's Encrypt, `/etc/letsencrypt/live/empressdreams.com`, renewed by `certbot.timer`
Uploaded images	`/var/www/empressdreams-store/public/storage`
Application log	`/var/www/empressdreams-store/storage/logs/laravel.log`
Backups	`/root/backups` (including backups made before the old site was removed and before the sample data wipe)

IMPORTANT

Other websites run on this same server (CakeZake, Kchha, Sadhai Coffee and others). Never restart nginx or the database carelessly. Always test the nginx config first and use `reload`, not `restart`.

14.2 Everyday commands

```
# connect
ssh root@147.93.19.1

# go to the app and clear caches (run after changing settings files or views)
cd /var/www/empressdreams-store
sudo -u www-data php artisan cache:clear
sudo -u www-data php artisan view:clear

# see recent errors
tail -n 50 storage/logs/laravel.log
tail -n 50 /var/log/nginx/error.log

# test and reload nginx safely
nginx -t && systemctl reload nginx

# restart PHP if pages hang
systemctl reload php8.3-fpm
```

14.3 Backups

Take a backup before every update and at least daily when the store is busy.

```
B=/root/backups/store-$(date +%F-%H%M); mkdir -p $B
mysqldump --single-transaction empressdreams_store > $B/database.sql
tar -czf $B/images.tar.gz -C /var/www/empressdreams-store/public storage
cp /var/www/empressdreams-store/.env $B/env.backup
```

To restore a database backup:

```
mariadb empressdreams_store < /root/backups/store-YYYY-MM-DD-HHMM/database.sql
```

> **TIP**
> Copy backups off the server regularly (to your computer or cloud storage). A backup on the same disk does not protect you from a server failure. Delete old backups you no longer need.

14.4 Updating the application

1. Make and test your changes on the development copy.
2. Take a backup (above).
3. Upload the files from your computer (do **not** overwrite `.env`, uploads or logs):

```
rsync -az --delete \
  --exclude '.env' --exclude 'storage/logs/*' --exclude 'storage/framework/*' \
  --exclude 'bootstrap/cache/*.php' --exclude 'public/storage' \
  ./ root@147.93.19.1:/var/www/empressdreams-store/
```

1. Fix ownership and apply database changes on the server:

```
cd /var/www/empressdreams-store
chown -R www-data:www-data storage bootstrap/cache
sudo -u www-data php artisan migrate --force
sudo -u www-data php artisan cache:clear
sudo -u www-data php artisan view:clear
```

1. Open the store, product page, checkout and admin to confirm everything works.

> **NOTE**
> `public/storage` holds live uploaded images. The command above deliberately excludes it so an update never deletes customer or product images.

14.5 SSL certificate

The certificate is renewed automatically by `certbot.timer`. It currently expires in December; check that renewal works:

```
certbot renew --cert-name empressdreams.com --dry-run
systemctl list-timers | grep certbot
```

14.6 Troubleshooting

Symptom	Likely cause and fix
White "Server Error" page (500)	Open `storage/logs/laravel.log` and read the last error. Fix it, then clear caches.
"No application encryption key has been specified"	The web server cannot read `.env`. Run `chown www-data:www-data .env && chmod 640 .env`, then clear caches.
Skin Analysis button does nothing; console says MIME type "application/octet-stream"	nginx must serve `.mjs` files as JavaScript. The site file contains a `location ~* \.mjs$` rule with `default_type application/javascript`; do not remove it.
Images missing on the store	Check `public/storage` exists and is readable; check file names in Media.
Cannot upload large images	Raise `client_max_body_size` in the nginx site and `upload_max_filesize` in PHP.
Camera does not open	Camera needs https and permission. Check the browser's site permissions.
Emails are not sent	Settings -> Mail is not configured. Enter SMTP details.
Changes to settings do not appear	Clear the cache: `php artisan cache:clear` as shown above.

Symptom	Likely cause and fix
Other websites stopped after an nginx change	Run `nginx -t`. If it fails, undo the change before reloading.

14.7 Security checklist

- Change the first admin password and keep it in a password manager.
- Replace the sample store email and phone, and use your real bank/QR details.
- Create separate staff users; remove users who leave.
- Keep `APP_DEBUG=false` in `.env` on the live server.
- Keep regular off-server backups and test a restore once.
- Keep the server updated (`apt update && apt upgrade`) during quiet hours.
- Do not publish the credentials file or the contents of `.env`.

CHAPTER 15

Daily routines and quick reference

15.1 Daily, weekly and monthly checklists

When	Do this
Every day (opening)	Open the POS register with the opening cash; check pending web orders; verify QR/bank payments.
Every day (closing)	Close the register, count the drawer, print the Z-report; process Completed orders.
Weekly	Batches & Expiry (expired/expiring); low stock; reply to reviews; check the laravel.log for repeated errors.
Monthly	Reports (sales, tax, products); take a backup and copy it off the server; review GlowPoints totals; update product prices and banners.

15.2 Frequently asked questions

Question	Answer
Can I use a barcode scanner I already own?	Yes. Any USB or Bluetooth scanner that acts as a keyboard works. Make sure it sends Enter after each code.
How do I sell a product that has no barcode?	Tap it on the screen, or give it a barcode under POS -> Barcodes & Labels.
A customer paid by QR but the sale shows Pending	That is correct. Verify the payment in POS -> Sales & Returns (or set the order to Processing/Completed in Sales -> Orders).
Why did a customer not receive points?	Points are awarded when the order is Completed. QR/bank sales need verification first.
Can I rename GlowPoints?	Yes. GlowPoints -> Settings -> Points name.
How do I change the VAT rate?	Online store: Products -> Taxes. POS: POS -> POS Settings (tax rate and mode).
How do I add a new size or colour?	Products -> Variations: open the variation and add a value; then add it to the product.
How do I remove demo/test data?	Delete the orders, customers and products you do not want; or ask your developer to wipe test data (a backup is taken first).
Is the customer's selfie stored?	No. It is analysed in the browser and never uploaded (unless the optional AI second opinion is switched on and the customer agrees).

15.3 Glossary

Term	Meaning
Attribute	A filterable property such as Skin Type or Material.
Variation / Variant	A choice such as Size or Colour / one exact combination, for example M - Maroon.
SKU	Stock keeping unit: your internal product code.
Barcode	Machine-readable number printed on labels and scanned at the till.
PAO	Period after opening: how long a cosmetic is good after opening.
INCI	The standard name list used for cosmetic ingredients.
Z-report	End-of-day cash register summary.
GlowPoints	The store's loyalty points.
Pending Payment	An order waiting for a QR or bank payment to be verified.
COD	Cash on Delivery.
VAT	Value Added Tax (13% in Nepal).

15.4 Need help?

Keep this guide with your store login details. For technical problems collect: what you did, the page address, a screenshot and the last lines of `storage/logs/laravel.log`, and share them with your developer.
